MORE THAN 400 PROFESSIONALS WITH PASSION

It is people, with their professionalism and dedication that make a great company. This profound conviction has always guided Pizzato Elettrica in their choice of employees and partners.

Today, Giuseppe and Marco Pizzato lead a tireless team providing the fastest and most efficient response to the demands of the market. This team has grown over the last 10 years and has achieved a considerable increase in sales in all the countries where Pizzato Elettrica is present.

The various strategic sectors of the business are headed by professionals with significant experience and expertise. Many of these people have developed over years with the company.

Others are experts in their specific field and have integrated personal experience with the Pizzato Elettrica ethos to extend the company's capability and knowledge.

From the design office to the technical assistance department, from managers to workers, every employee believes in the company and its future. Pizzato Elettrica employees all give the best of themselves secure in the knowledge they are the fundamental elements of a highly valuable enterprise.

100% MADE IN ITALY

Pizzato Elettrica is one of the leading European manufacturers of position switches, microswitches, safety devices, safety modules, foot switches, control and signalling devices, and devices for lifts. An entrepreneurial company such as Pizzato Elettrica bases its foundations on a solid and widely shared value system. The pillars that form the basis of the company's work have remained constant, and constitute the fundamental guiding principles for all company activities.

PASSION FOR QUALITY

Passion for product quality, orientation towards excellence, innovation, and continuous development, represent the key principles of Pizzato Elettrica's everyday work.

Anyone using Pizzato Elettrica's products does so in the certainty that these devices are of certified quality, since they are the result of a process that is scrupulously controlled at every stage of the production.

The company's goal is to offer the market safe, reliable, and innovative solutions.

CARE FOR THE CUSTOMER

In order to be successful, a product must respond to the specific needs of those who will use it. Market developments must be carefully monitored in order to understand, in advance, which new applications will prove themselves truly useful. This is why Pizzato Elettrica has always cultivated close synergies with the companies that have chosen it as a supplier, using this continuous dialogue to identify the potential developments of the own product range in order to make it highly flexible, complete and capable to respond to the most diverse needs.

100% MADE IN ITALY

All Pizzato Elettrica products are designed, developed, and tested entirely at the company plants in Marostica, in the province of Vicenza in Italy. The company is thus able to meet specific customer requirements at all times, by offering a comprehensive range of products and technologically advanced solutions.

1984: AN ENTREPRENEURIAL STORY BEGINS

- 1984** The company Pizzato di Pizzato B. & C. snc. manufacturer of position switches is founded.
- 1988** The company becomes a limited liability partnership, and is renamed Pizzato Elettrica, a brand shortly destined to become renowned and valued nationwide.
The first company-owned plant (P1) geared towards mechanical processing was built.
- 1990** By the end of the decade, thanks to the development of quality products and the experience built on the Italian market, Pizzato Elettrica turns to the international market.
- 1995** Building of the second plant (P3) geared towards the moulding of plastic materials. Development of the position switch range continues in parallel. Start of significant years in terms of safety devices planning. The safety sector becomes a key sector to the company.
- 1998** Construction of the third plant (P4), housing the assembly department.
- 2002** Achievement of the ISO 9001:2000 certification. Launching of the first safety modules. The new factory headquarters and logistics centre (P5) is built and will remain the company's headquarters for many years. Continued expansion of the industrial safety and automation product range.
- 2007** Pizzato Elettrica faces its first generational change: Giuseppe and Marco Pizzato take over the company directorship.
- 2010** Extension of Pizzato Elettrica product portfolio, with the launch of the innovative EROUND line consisting of control and signalling devices. This product range accompanies position switches and safety devices, thus offering complete solutions to customers.
- 2012** Introduction of Gemnis Studio, the first software produced by Pizzato Elettrica. A graphic development environment for the creation, simulation, and debugging of programs that can be integrated in the Gemnis line modules.
- 2013** Foundation of first subsidiary of Pizzato Elettrica, Pizzato Deutschland GmbH, in Germany.
- 2014** A new production facility (P8) dedicated to switches and automatic machines is opened, spanning a surface area of 6000 m².
- 2016** The new NS series of safety switches with electromagnets and RFID technology is introduced, fruit of the company's experience, spanning more than thirty years in the field of industrial safety. To date it is the state of the art in its industry.
Foundation of second subsidiary of Pizzato Elettrica, Pizzato France SARL, in France.
- 2017** The company continues to expand and achieves the quality certification based on the more recent version of standard ISO 9001 of 2015. In Spain, the third Pizzato Elettrica subsidiary is founded: Pizzato Iberica SL.
The foundation stone is laid for the new factory (P6), which is to become the company's headquarters.
- 2018** The safety handle P-KUBE Krome is launched, a brand new product in the market, confirming that Pizzato Elettrica thrives on innovation in the sectors of automation and industrial safety.
Foundation of fourth subsidiary of Pizzato Elettrica, Pizzato USA Inc, in the United States.
- 2019** The new factory (P6) is opened, a modern building of 28,000 m² realized with the most advanced Industry 4.0 technologies, where all offices and production divisions are transferred, allowing to further improve the flow of material and information.
The logistics and shipment department is optimised with the introduction of a new completely automated warehouse.
- 2021** Pizzato Elettrica India Ltd. and Pizzato Korea Ltd., commercial branches of Pizzato Elettrica, are established in India and South Korea, respectively.
- 2022** Foundation of Pizzato Academy, Pizzato Elettrica's new training site for getting better acquainted with our products and following the constant regulatory developments in the sector.
- 2023** Pizzato Shanghai Trading Co. Ltd. is founded, as the seventh subsidiary of Pizzato Elettrica, based in China. Pizzato Academy training adds classroom courses focused on Gemnis Studio software to its existing webinars. The SPS – Smart Production Solutions trade fair in Nuremberg is the launchpad for the revolutionary NX series of RFID safety locking switches, the smallest in the world.
- 2024** Pizzato UK Ltd. is established in the United Kingdom, as the eighth branch of Pizzato Elettrica.
- Today**, Giuseppe and Marco Pizzato lead a company in constant growth in terms of new product launches, number of employees, turnover, and new markets. Pizzato Elettrica is continuing its new product internationalisation and development process.

MORE THAN 100 MILLION PARTS SOLD WORLDWIDE

Pizzato Elettrica's product catalogue contains more than 10,000 articles, with more than 1,500 special codes developed for devices personalised according to clients' specific needs. Pizzato Elettrica devices can be grouped, according to typology, into three main macro-categories.

POSITION SWITCHES

Pizzato Elettrica position switches are daily installed in every type of industrial machinery all over the world for applications in the sector of wood, metal, plastic, automotive, packaging, lifting, medicinal, naval, etc.

In order to be used in a such wide variety of sectors and countries, Pizzato Elettrica position switches are made to be assembled in a lot of configurations thanks to the various body shapes, dozens of contact blocks, hundreds of actuators and materials, forces, assembling versions.

Pizzato Elettrica can offer one of the widest product range of position switches in the world. Moreover, the use of high quality materials, high reliability technologies (e.g. twin bridge contact blocks) as well as the IP67 protection degree make this range of position switches one of the most technologically evolved.

SAFETY DEVICES

The company Pizzato Elettrica has been one of the first Italian companies developing dedicated items for this sector, creating and patenting dozens of innovative products, thus becoming one of the main European manufacturers of safety devices.

The wide range of specific products for the safety of machinery, entirely designed and assembled in the company's Marostica (VI) premises, includes the more traditional safety switches with separate actuator (with or without locking mechanism) and hinge switches, but also the state-of-the-art devices with anti-tamper RFID technology such as the ST series sensors and the NG, NS and NX series locking devices.

The product range is completed by safety handles for guards, including the innovative P-KUBE Krome model, featuring an illuminated grip with multicolour signalling LED. It also includes the CS series safety modules, available in single-function version or user-programmable via the Gemnis Studio software — fully developed by Pizzato Elettrica and distributed under a free licence — along with the BC series passive distribution box and the P-Connect connection gateway. The range of ES series housings with control devices now includes new ES series housings with illuminated

guard and buzzer, while the control device units of the BN series are now available also with IO-Link technology.

MAN-MACHINE INTERFACE

Pizzato Elettrica's control and signalling devices of the EROUND line are designed for the use in the human-machine interface sector. Thanks to the elegant design, the care for details and the elegance of the product combined with its maximum safety and reliability, this series is one of the most complete and cutting-edge on the market.

In order to satisfy its customers' needs and requests, Pizzato Elettrica offers a lot of accessories purposely designed to complement its wide range of products and for the installation of these devices on machinery.

MILLIONS OF CERTIFIED PRODUCT CODES

A simple brand isn't enough: the company is aiming for the Pizzato Elettrica brand to be widely recognised as a synonym for absolute quality and certainty.

A result that has been reached and consolidated over the years, updating and expanding the series of certifications obtained from the most important Italian and international control organisations. Product quality is verified by certification bodies issuing a range of quality marks: IMQ, UL, CCC, TÜV SÜD, EAC. These bodies lay out high technical and qualitative standards for the company to achieve and maintain, verified yearly with several inspections: these are performed, without prior notice, by qualified inspectors, who extract samples of products and materials destined for sale from plants, or from the market directly, to subject them to on-site tests.

- **CE MARK.** All Pizzato Elettrica products bear the CE marking in conformity with the European Directives in force.
- **UKCA MARK.** All Pizzato Elettrica products bear the UKCA marking in conformity with the United Kingdom directives in force.
- **ISO 9001 CERTIFICATION.** The company's production system is compliant with the international ISO 9001 standard, in its most recent 2015 revision. The certification covers all of the compa-

ny's plants and their production and managerial activities: entry checks, technical, purchasing and commercial department activities, manufacturing operations assessments, final pre-shipping product tests and checks, equipment reviews and the management of the metrological lab.

The Pizzato Elettrica quality management system ensures that all sensitive company processes – from component design to implementation, from materials provisioning to verification of non-compliant products – are carried out according to the procedures laid down, with the aim of providing our customers with continuously improved and reliable products.

- **CERTIFICATION OF COMPANY QUALITY SYSTEMS.** Pizzato Elettrica has obtained the certificate of compliance with the UNI EN ISO 9000 regulations in force in Italy and abroad. It is issued by a recognised independent body that guarantees the quality and reliability of the service offered to clients worldwide.
- **CSQ, CISQ AND IQNET.** The CSQ system is part of the CISQ (Italian Certification of Quality Systems) federation, which consists of the primary certification bodies operating in Italy in the various product sectors. CISQ is the Italian representative body within IQNet, the biggest international Quality Systems and Company Management certification network, which is adhered to by 25 certification organs in as many countries.

The purpose of these subsidiaries is to coordinate and support the activities of representative agencies, or distributors, present in the various countries, managing marketing and sales activities, with further objectives of increasing brand visibility and penetration capacity of Pizzato Elettrica products in markets considered strategic.

Products from Pizzato Elettrica are currently used in over 80 countries: The commercial support network, which is made up of local professional and experienced representatives, combined with the productive capacity of the headquarters in Italy, are the basis for the formation of a group that, together with its partners, has all the necessary requirements to become one of the most important companies in the field of automation and industrial safety.

TECHNICAL AND SALES ASSISTANCE

TECHNICAL DEPARTMENT

The Pizzato Elettrica technical department provides direct technical and qualified assistance in Italian and English, helping in this way the customers to choose the suitable product for their own application explaining the characteristics and the correct installation.

Office hours: Monday to Friday
08:00 am - 12:30 pm / 02:00 pm - 05:30 pm CET
Telephone: +39.0424.470.930
E-mail: tech@pizzato.com

Spoken languages:

SALES DEPARTMENT

Among the strengths in the company relationship with the commercial network, the direct assistance guaranteed in five languages: Italian, English, French, German and Spanish. A service that confirms Pizzato Elettrica quality and attention to the needs of customers from around the world.

Office hours: Monday to Friday
08:00 am - 12:30 pm / 02:00 pm - 05:30 pm CET

TRADE FAIRS AND EVENTS

TRADE FAIRS

Pizzato Elettrica regularly participate to many trade fairs in Italy and abroad, presenting in this way to the market the products, the latest news, etc.

EVENTS

Besides offering qualified technical assistance, Pizzato Elettrica presents itself as a dynamic partner who is attentive to the needs of its customers. For this reason, the company organises several meetings and training courses with particular attention to the regulatory aspect of machinery safety.

WEBSITE WWW.PIZZATO.COM

PRODUCT NEWS

Visit the website at www.pizzato.com to stay updated on all the news regarding product launches, to view the entire range of products created by Pizzato Elettrica, and to consult all the documentation provided.

SEARCH USING FILTERS

You can find the product you want by entering the relative item code, or use the filters provided to create the item most adapted to your particular requirements, by choosing the features it needs to offer.

BROWSABLE, DOWNLOADABLE CATALOGUE

Users can download the complete catalogue or alternatively browse it directly online, an extremely handy solution for those wishing to consult the range of products simply and rapidly.

HIGH RESOLUTION IMAGES

The information provided for each product is complete with high resolution images to offer visitors to the website a clear, accurate view of the items in close detail, also offering them the possibility to zoom in and out on the image.

USAGE INSTRUCTIONS

You can download product usage or installation instructions, in PDF format, to your computer.

2D AND 3D FILES

2D and 3D drawings are available for every item; in formats that are compatible with the widest variety of drawing programs.

CERTIFICATES

The latest product type approval certificates, and EC declarations of conformity in accordance with applicable European product directives, are published on the website.

VIDEO GALLERY

The large video section of the website is capable of showcasing the main characteristics, functions and use of the various products.

MULTILINGUAL TRANSLATIONS

The website's multilingual versions allow the clients of the global market to find all the information they need in one place.

WEBINARS

The webinars from Pizzato Elettrica go into detail in the area of machine safety with focus on the further development of standards. The speakers are experts with targeted specialisation and detailed knowledge of standards and directives in the industry.

CROSS-REFERENCE

It is possible to find a Pizzato Elettrica product as an alternative to others on the market in terms of functionality.

NX series RFID safety switches with lock

- Maximum technology in the minimum volume: the world's smallest RFID safety switch with lock.
- Compact dimensions, with a volume of just 85 cm³.
- Safety levels PL e, SIL 3.
- Increased actuator holding force: $F_{1max} = 6000\text{ N}$ and $F_{zh} = 3000\text{ N}$
- TÜV and cULus approvals.
- ECOLAB certificate, which attests resistance to hygiene and cleaning products commonly used in the food & beverage industry.
- Metal head and technopolymer body.
- RGD LED illuminated cover.
- Operating principle with bistable solenoid.
- Head with three entry openings for the actuator.
- Jointed actuator for inaccurately closing guards.
- Versions with 3 auxiliary releases located on three sides of the switch.
- Versions with M12 connector output, integrated cable, or integrated cable with M12 connector. Connection of up to 32 switches in series.

► 205

P-KUBE Lite safety handles

- Can be combined with FY and FG series switches featuring separate actuator with lock.
- Modern and ergonomic design that allows implementation of machines and guards with particularly pleasing aesthetics.
- Flexible installation: the symmetrical design ensures that the handle is compatible with any type of sliding or hinged door, right or left, without the need to disassemble the actuator.
- Strong centring pin compelling alignment between door and switch, guaranteeing correct insertion of the actuator.
- Actuator immovably fixed to the handle body.
- Optional handle block button.
- Optional coded key lock (tubular or standard).
- Optional internal lever for emergency escape.
- Optional lock-out device.

► 241

P-Connect connection gateway for safety devices

- The system allows up to 6 safety devices to be connected to a data network, whereby safety information is exchanged via industrial Ethernet protocols.
- Depending on the configuration, possibility to connect various devices from Pizzato Elettrica such as safety switches of the NG and NS series.
- Multiple P-Connect gateways can be connected in series.
- Plug and Play device that reduces wiring time.
- Quick access to diagnostic data.
- Aluminium housing, baked powder coating.
- Protection degree IP65.
- The 3 integrated signal LEDs provide better diagnostic visualisation in the field.

► 327

Restyling of series F switches for standard applications

- Modern design with rounded shapes.
- Housing in anthracite-grey technopolymer.
- Laser engraving, which is indelible and weather resistant.
- Hinged cover, equipped with non-detachable gasket and fixed with single captive screw for easier wiring.
- Metal plates (available in stainless steel on request) applied to the housing's mounting holes to ensure a robust and reliable fixing (FR, FK and FX series).
- Protection degree IP67 and up to IP69K for switches without exposed rubber parts.
- Standard M20 thread also for FK series.

► 91

BN series control device units

- Laser-markable lenses are available for buttons: the desired markings are permanently applied directly to the lenses by means of lasers.
- Wide range of available control devices.
- Rotatable modules for the greatest installation flexibility.
- Coloured lenses and laser-marked lenses for buttons available separately.
- New yellow protection guard for emergency stop button.
- Configurable with various types of connection output.
- Min. dimensions 40x40 mm.

► 305

BN control device units with IO-Link technology

- All features of the BN series with the added benefit of IO-Link technology.
- Accurate monitoring of all operating phases.
- Immediate detection of any anomalies.
- Plug & Play device for quicker wiring.
- Option to add RGB illuminated command buttons with adjustable brightness.
- Coloured lenses and laser-marked lenses for buttons available separately.

► 319

Passive distribution box - BC series

- Tidy and efficient wiring.
- Improved power distribution.
- Protection degree IP67.
- State signalling LED.
- Series connection of multiple safety devices.
- Flexible connection with availability of different I/O versions.

► 345

FY series safety switches with separate actuator with lock

- Housing made of glass fibre reinforced technopolymer, shock-proof and self-extinguishing.
- Strong interlocking system that guarantees a maximum actuator holding force of 2800 N.
- Select between 30 configurations of the 4-pin contact blocks.
- Protection degree up to IP67 and IP69K.
- Versions with key release and escape release button.
- Versions with the possibility to integrate up to 2 control devices in the cover.
- 4 types of actuators made of stainless steel available for different types of applications.
- Head and release devices can be individually aligned on the switch in 4 directions and are non-detachable.
- 2 signalling LEDs that can be used to display the various operating states of the switch from the outside.

► 137

NG series with protection guard for emergency stop button

- Sturdy protective cover to prevent accidental impacts on the emergency stop button.
- Suitable for all NG versions with integrated control devices and emergency stop buttons.

► 169

ES series housing with illuminated guard and buzzer

- Cover with illuminated upper guard.
- Integrated buzzer.
- Version with multicolour illuminated white cover featuring RGB LED.
- Version with illuminated yellow cover also suitable for use in lift sector.
- Internal wiring with terminal strip for continuous or intermittent modes for the light and acoustic signals.
- Available in wired version featuring a M12 connector output.
- Protection degree IP69K.

► 299

NS series safety switch with integrated reset function

The NS series switches with reset function offer the same safety features of the standard NS safety switch as well as a new function for manually resetting the interlocking function directly on the device. The devices feature a dedicated input for the reset command and an additional "ACK" signalling LED (acknowledgement) for the state of the reset function that illuminates if a manual reset has occurred.

- Integrated reset function.
- Compatible with standard Euromap 78.
- Compatible with standard Euromap 78.1.

► 187

Coded tamper-protection systems

- Coded screw covers for switches and actuators
 - Coded covers with alphanumeric marking.
 - Removal possible only by breaking the covers.
 - Available for series SR, SM A, ST G, ST D, ST H, SM G, SM H, SM D, SM L, SM E, AN, NG (actuator), NS and NX.
- Coded covers for M12 connectors
 - New version with coded alphanumeric marking.
 - Quick assembly with two snap-on shells.
 - Removal possible only by breaking the shells.
 - Different versions available for connector - device and male connector - female connector connections.
 - Versions available in detectable blue plastic, suitable for the food industry.
- Every cover carries a unique code. This means that every application and replacement can be tracked, guaranteeing their tamper-protection function.

► 371

Door holding magnets

- Holding force of 40 N.
- Fully sealed.
- Rust free.
- Greater protection compared to simple solutions on the market.

► 370

Connectors M8, M12 with new fixing ring, M23

- Large selection of connectors for cables and switch panels: optimal solution for use in combination with Pizzato switches.
- M12 connectors with new fixing ring with grooved circular and hexagonal attachment for tightening with torque-controlled tools. Available in male and female versions.
- Gold-plated contacts for increased reliability.
- Anti-vibration self-locking ring nuts.
- Highly flexible cables, suitable for use in drag chains, with oil-resistant PVC or PUR sheath acc. to IEC 60332-1-2.

► 353

Protective guard for emergency stop buttons for the BN and NS series

- Protective cover that absorbs undesired shocks on the emergency stop button.
- Suitable for all BN and NS versions with integrated control devices and emergency stop buttons.
- Laser-markable in compliance with EN ISO 13850.

Description

These safety switches are ideal for controlling gates, sliding doors and other guards which protect dangerous parts of machines without inertia.

The stainless steel actuator is fastened to the moving part of the guard in such a way that it is separated from the switch each time the guard is opened. A special mechanism ensures that removing the actuator forces the positive opening of the electrical contacts. Easy to install, these switches can be used with all types of guards (with hinge as well as sliding and removable types). The possibility to actuate the switch only with a specific actuator guarantees that the machine can be restarted only after the guard has been closed. These switches are made of robust materials with larger dimensions and are designed especially for heavy gates and harsh environments.

Heads with variable orientation

For all switches, the head can be adjusted in 90° steps after removing the two fastening screws. In this way it is possible to actuate the switch from 5 different directions.

Wide-ranging actuator travel

The actuation head of this switch features a wide range of travel. In this way the guard can oscillate along the direction of insertion (4.5 mm) without causing unwanted machine shutdowns. This wide range of travel is available in all actuators in order to ensure maximum device reliability.

Protection degree IP67

IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529.

They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Safety screws for actuators

As required by EN ISO 14119, the actuator must be fixed immovably to the guard frame. Pan head safety screws with one-way fitting are available for this purpose. With this screw type, the actuators cannot be removed or tampered by using common tools. See accessories on page 353.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Features approved by IMQ

Rated insulation voltage (U_i):	500 Vac 400 Vac (for contact blocks 2, 11, 12, 20, 21, 22, 28, 29, 30, 33, 34, 37)
Conventional free air thermal current (I_{th}):	10 A
Protection against short circuits:	type aM fuse 10 A 500 V
Rated impulse withstand voltage (U_{imp}):	6 kV 4 kV (for contact blocks 20, 21, 22, 28, 29, 30, 33, 34)
Protection degree of the housing:	IP67
MV terminals (screw terminals)	
Pollution degree:	3
Utilization category:	AC15
Operating voltage (U_e):	400 Vac (50 Hz)
Operating current (I_a):	3 A
Forms of the contact element:	Za, Za+Za, X+X, Zb, Y+Y, Y+Y+X, Y+Y+Y, Y+X+X, Y, X.
Positive opening of contacts on contact blocks	5, 6, 7, 8, 9, 11, 13, 14, 16, 17, 18, 19, 20, 21, 22, 28, 29, 30, 33, 34, 37, 38, 39, 66.
In compliance with standards:	EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU.

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings:	Q300 pilot duty (69 VA, 125-250 V dc) A600 pilot duty (720 VA, 120-600 V ac)
Environmental Ratings:	Types 1, 4X, 12, 13
Use	60 or 75 °C copper (Cu) conductor and wire size range 12, 14 AWG, stranded or solid. The terminal tightening torque of 7.1 lb in (0.8 Nm).
For FP series:	the hub is to be connected to the conduit before the hub is connected to the enclosure.

How to read travel diagrams

IMPORTANT:

The state of the NC contact refers to the switch with inserted actuator. In **safety applications**, actuate the switch **at least up to the positive opening travel** shown in the travel diagrams with symbol ⊕. Actuate the switch **at least with the positive opening force**, reported in brackets below each article, next to the actuating force value.

Limits of use

- Do not use where dust and dirt may penetrate in any way into the head and deposit there. In particular where metal dust, concrete or chemicals are spread.
- Adhere to the EN ISO 14119 requirements regarding low coding level for interlocks.
- Do not use in environments with presence of explosive or flammable gases or dusts. In these cases use ATEX products (see dedicated Pizzato catalogue).

Stainless steel actuators

IMPORTANT: These actuators can be used only with items of the FD, FP, FL, FC and FS series (e.g. FD 693-M2).
Low coding level acc. to EN ISO 14119.

The actuator can flex in four directions for applications where the guard alignment is not precise.

Actuator adjustable in two directions for guards with reduced dimensions.

Actuator adjustable in one direction for guards with reduced dimensions.

Jointed actuator for guards with poor alignment, adjustable in two dimensions for small doors; can be mounted in various positions. The metal fixing body has two pairs of bore holes; it is provided for rotating the working plane of the actuator by 90°.

Accessories

Padlockable lock-out device to prevent the actuator entry and the accidental closing of the door behind operators while they are in the danger area.

Description

These safety switches are ideal for controlling gates, sliding doors and other guards which protect dangerous parts of machines without inertia. The stainless steel actuator is fastened to the moving part of the guard in such a way that it is separated from the switch each time the guard is opened. A special mechanism ensures that removing the actuator forces the positive opening of the electrical contacts. Easy to install, these switches can be used with all types of guards (with hinge as well as sliding and removable types). The possibility to actuate the switch only with a specific actuator guarantees that the machine can be restarted only after the guard has been closed.

Heads with variable orientation

For all switches, the head can be adjusted in 90° steps after removing the two fastening screws. In this way it is possible to actuate the switch from 5 different directions.

Wide-ranging actuator travel

The actuation head of this switch features a wide range of travel. In this way the guard can oscillate along the direction of insertion (4 mm) without causing unwanted machine shutdowns. This wide range of travel is available in all actuators in order to ensure maximum device reliability.

Not detachable head

To make head adjustment safer and smoother, these switches are equipped with a special head to body coupling system. This system makes it impossible to remove the head from the device even during adjustment, thus rendering the use of one-way screws unnecessary for locking the head in position once adjustment is complete. This solution is available for the FR, FX and FK series.

Versions with 30 N actuator extraction force

Versions with 30 N actuator holding force instead of the standard 10 N are available.

Protection degrees IP67 and IP69K

IP69K
IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test according to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Safety screws for actuators

As required by EN ISO 14119, the actuator must be fixed immovably to the guard frame. Pan head safety screws with one-way fitting are available for this purpose. With this screw type, the actuators cannot be removed or tampered by using common tools. See accessories on page 353.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

- Adhere to the EN ISO 14119 requirements regarding low coding level for interlocks.
- Do not use in environments with presence of explosive or flammable gases or dusts. In these cases use ATEX products (see dedicated Pizzato catalogue).

IMPORTANT: These actuators can only be used with items of the FR, FX, FK and FW series (e.g. FR 693-M2).
Low coding level acc. to EN ISO 14119.

Description

Coded magnetic sensors are devices suitable for monitoring protections and guards of machines without inertia which, when linked to a safety module, can create a system with safety category up to SIL 3 according to EN IEC 62061, up to PL e according to EN ISO 13849-1 and up to category 4 according to EN ISO 13849-1.

These products consist of a sensor that detects the magnetic field and which is connected to the machine structure and of a coded magnetic actuator, which is connected to the movable guard. When the sensor and actuator are approached (closed guard), the sensor detects the actuator and actuates the electrical contacts. The sensor is designed to be activated only by the correct coded actuator and not through a common magnet.

Insensitivity to dirt

Magnetic sensors are totally sealed and retain their safety characteristics also where dirt and dust are present (not ferromagnetic material). This characteristic, combined with the design without recesses, makes them particularly suitable for use in the food industry.

Wide actuation range

With their built-in features, magnetic sensors have a wide actuation range, making them very well suited for applications with large tolerances or where mechanical properties change over time.

In this type of sensor, the actuation distances may vary depending on the shift direction of the actuator in relation to the sensor.

Actuation from many directions

The coded magnetic sensors were designed to be activated by the respective actuator from various directions. The customer therefore enjoys maximum flexibility when positioning devices along the perimeter of the guards.

Stainless steel fixing plates

To prevent damage to the fixing slots when fastening on non-perfectly flat surfaces, coded magnetic sensors are equipped with stainless steel fixing plates. Even in the presence of suitable fixing surfaces, this solution makes the sensor more robust against mechanical stresses.

Assembly of multiple sensor-actuator systems

It is possible to install more than one device on the same machine. The minimum mounting distance between sensor-actuator systems is only 50 mm.

Safety screws for actuators

As required by EN ISO 14119, the actuator must be fixed immovably to the door frame. Pan head safety screws with one-way fitting are available for this purpose. With this screw type, the actuators cannot be removed or tampered by using common tools. See accessories on page 353.

Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Series connection of multiple sensors

The coded magnetic sensors can be connected in series with the only limitation that the overall resistance, of sensors and the related wiring, has to be not higher than the admitted max. value of the module, which typically is equal to 50 ohm (see module features). This is a very high value that, with normal wiring, allows the use of dozens of sensors without problems. It is also possible to realise mixed circuit solutions by connecting coded magnetic sensors in series to safety switches, with the only limitation being the above-mentioned maximum electrical resistance.

It should be noted that the series connection of two or more coded sensors reduces the self-monitoring capacity of the system, see ISO/TR 24119.

The use of Pizzato Elettrica safety modules is recommended.

Protection degrees IP67 and IP69K

IP69K
IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing. Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

For female connectors, see page 353.

Connection with safety modules

A coded magnetic sensor alone cannot be used for safety functions because its operating principles are not considered safe by the standards (e.g. positive opening on mechanical switches). For this reason, a magnetic sensor coded for use in safety applications must always be connected to a safety module that monitors its proper operation through a circuit with at least two channels.

Compatible safety modules

The magnetic sensors have been tested and approved for operation with suitable safety modules (see list).

The use of complete and tested solutions guarantees the electrical compatibility between the sensor and safety module, as well as high reliability.

Accessories

Spacer

If possible do not mount the sensor and the actuator on ferromagnetic materials.

This spacer is placed between the magnetic safety sensors and metal surfaces that can deflect the magnetic field: as a result, the activation and deactivation distances of the sensor remain the same.

Because it is made out of a single block of material, it is especially well suited for applications where a high level of cleanliness is required, as any material present in the installation area cannot penetrate and accumulate.

Description

Coded magnetic sensors are devices suitable for monitoring protections and guards of machines without inertia which, when linked to a safety module, can create a system with safety category up to SIL 3 according to EN IEC 62061, up to PL e according to EN ISO 13849-1 and up to category 4 according to EN ISO 13849-1. These products consist of a sensor that detects the magnetic field and which is connected to the machine structure and of a coded magnetic actuator, which is connected to the movable guard. When the sensor and actuator are approached (closed guard), the sensor detects the actuator and actuates the electrical contacts. The sensor is designed to be activated only by the correct coded actuator and not through a common magnet.

Insensitivity to dirt

Magnetic sensors are totally sealed and retain their safety characteristics also where dirt and dust are present (not ferromagnetic material).

This characteristic, combined with the design without recesses, makes them particularly suitable for use in the food industry.

Wide actuation range

With their built-in features, magnetic sensors have a wide actuation range, making them very well suited for applications with large tolerances or where mechanical properties change over time.

In this type of sensor, the actuation distances may vary depending on the shift direction of the actuator in relation to the sensor.

Protection against tampering

Each sensor and actuator of the SR A series is supplied complete with snap-on protection caps to be applied on the holes of the fixing screws. Not only do the caps prevent dirt from accumulating and simplify cleaning, they also block access to the fastening screws of the actuator. As a result, standard screws can be used instead of tamper-proof screws.

Actuation from many directions

The coded magnetic sensors were designed to be activated by the respective actuator from various directions.

The customer therefore enjoys maximum flexibility when positioning devices along the perimeter of the guards.

Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Assembly of multiple sensor-actuator systems

It is possible to install more than one device on the same machine. The minimum mounting distance between sensor-actuator systems is only 50 mm.

Protection degrees IP67 and IP69K

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing. Due to

their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Series connection of multiple sensors

The coded magnetic sensors can be connected in series with the only limitation that the overall resistance, of sensors and the related wiring, has to be not higher than the admitted max. value of the module, which typically is equal to 50 Ω (see module features). This is a very high value that, with normal wiring, allows the use of dozens of sensors without problems. It is also possible to realise mixed circuit solutions by connecting coded magnetic sensors in series to safety switches, with the only limitation being the above-mentioned maximum electrical resistance.

It should be noted that the series connection of two or more coded sensors reduces the self-monitoring capacity of the system, see ISO/TR 24119. The use of Pizzato Elettrica safety modules is recommended.

Accessories

Spacer

If possible do not mount the sensor and the actuator on ferromagnetic materials. This spacer is placed between the magnetic safety sensors and metal surfaces that can deflect the magnetic field: as a result, the activation and deactivation distances of the sensor remain the same. Because it is made out of a single block of material, it is especially well suited for applications where a high level of cleanliness is required, as any material present in the installation area cannot penetrate and accumulate.

Article	Description
VS SP1AA1	Technopolymer spacer for SR A series sensors

Introduction

In combination with the corresponding safety modules, the sensors of the ST D series are suitable for the monitoring of protective devices on machines without inertia and allow the system in which they are used to reach a safety category up to SIL 3 acc. to EN IEC 62061 as well as up to PL e and Category 4 acc. to EN ISO 13849-1. These sensors use RFID (Radio Frequency IDentification) technology and provide high protection against possible manipulation thanks to the uniqueness of the codes transmitted by the actuator. Because they have no mechanical elements, they guarantee a long service life even in applications with frequent operating cycles and under harsh environmental conditions.

Maximum safety with a single device

PL e + SIL 3

The sensors of the ST D series are constructed with redundant electronics. As a result, the maximum PL e and SIL 3 safety levels can still be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a module suitable for managing devices with semiconductor outputs, or to a safety PLC.

Series connection of multiple sensors

PL e + SIL 3

One of the most important features of the ST D series from Pizzato Elettrica is the possibility of connecting up to 32 sensors in series, while still maintaining the maximum safety level (PL e) laid down in EN 13849-1.

This connection type is permissible in safety systems which have a safety module at the end of the chain that monitors the outputs of the last ST sensor.

The fact that the PL e safety level can be maintained even with 32 sensors connected in series demonstrates the extremely secure structure of each sensor of the ST series.

Series connection with other devices

PL e + SIL 3

The ST D series features two safety inputs and two safety outputs, which can be connected in series with other Pizzato Elettrica safety devices. This option allows the creation of safety chains containing various devices. For example, stainless steel safety hinges (HX BEE1 series), transponder sensors (ST series) and door lock sensors (NG or NS series) can be connected in series while still maintaining the maximum PL e and SIL 3 safety levels.

Actuators with high coding level

The ST D series is provided with an electronic system based on RFID technology to detect the actuator. This allows to provide each actuator with different coding and makes it impossible to tamper with a device by using another actuator of the same series. Millions of different coding combinations are possible for the actuators. They are therefore classified as high level coded actuators, according to EN ISO 14119.

Protection degrees IP67 and IP69K

IP69K
IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing. Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Wide actuation range

By utilising the properties of RFID technology, the sensors of the ST D series have a wide actuation range, making them very well suited for applications with large tolerances or where mechanical properties change over time.

Actuation from many directions

The sensors of the ST D series from Pizzato Elettrica were designed to be activated from various directions, thereby providing the customer with maximum flexibility when positioning the sensors on the guards. Furthermore, the SM D•T actuator can be secured in two mutually orthogonal directions.

Programmability

Pizzato Elettrica supplies a programmable version of the ST D series sensors. With a simple and brief operation, the sensor can be programmed to recognise the code of a new actuator.

By activating a special input, the sensor is switched to a safe state, during which it waits for a new code to be accepted. As the actuator approaches, the ST D sensor performs a number of checks on the code being received, whereby the code must adhere to certain parameters of RFID technology.

If the checks are successful, the sensor uses LEDs to signal the successful completion of the procedure.

After programming has been completed, the sensor only recognises the code of the last programmed actuator, thereby preserving the safety level and the reliability of the system in which it is installed.

Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Short signal propagation delay

One of the main features of the ST D sensors is the short signal propagation time of approx. 7 ms after deactivation of the inputs.

This short signal propagation time is particularly advantageous for sensors connected in series.

Stainless steel fixing plates

The stainless-steel fixing plates for the ST D sensors not only protect the mounting eyes during installation on surfaces that are not perfectly flat, they also help the sensor better withstand mechanical loads. As a result, the system is safer and more reliable.

Protection against tampering

Each sensor and actuator of the ST D series is supplied complete with snap-on protection caps to be applied on the holes of the fixing screws. Not only do the caps prevent dirt from accumulating and simplify cleaning, they also block access to the fastening screws of the actuator. As a result, standard screws can be used instead of tamper-proof screws.

Four LEDs for immediate diagnosis

As the LEDs have been designed for quick immediate diagnosis, the status of each input and output is highlighted by one specific LED. By knowing which device is active and which door is open, it is possible to quickly identify an interruption in the safety chain as well as any internal device errors. All of this at a glance, without needing to decode complex flashing sequences.

Insensitivity to dirt

The sensors are completely sealed and retain their safety characteristics even in the presence of dirt or deposits (not ferromagnetic material).

Versions with increased actuation distance

In addition to the standard actuation distance of 12 mm, sensors with an actuation distance of 20 mm are also available. The increased actuation distance of the sensors is ideal for installation situations in which it is not possible to ensure that the actuator approaches the sensor in a precise and stable manner.

New compact actuators

In addition to the standard actuators, the new compact actuators SM L•T are now available to order; these actuators have a single mounting direction (frontal) and maintain the same actuation distance of 12 mm as the actuator SM D•T.

Due to the reduced thickness (just 7 mm), they can be installed in all applications with restricted space conditions and thereby enable use of RFID technology, even with guards of small dimensions.

External device monitoring

EDM On request, the switch can be supplied with EDM function (External Device Monitoring). In this case, the switch itself checks the proper function of the devices connected to the safety outputs. These devices (usually relays or safety contactors) must send a feedback signal to the EDM input, which checks that the received signal is consistent with the state of the safety outputs.

Extended supply voltage range

In addition to the standard 24 Vdc supply voltage, the ST D series sensors are available with an extended supply voltage of 12 ... 24 Vdc (articles ST D•••1••). This characteristic makes them particularly suitable for use in the automotive sector, in machines powered by common battery systems, and both in light and heavy vehicles.

high	SM L1T	SM D1T	SM E1T

The use of RFID technology in ST series sensors makes them suitable for several applications. Pizzato Elettrica offers two different versions of actuators, in order to best suit customers' specific needs.

Type **•0T** actuators are all encoded with the same code. This implies that a sensor associated with an actuator type **•0T** can be activated by other actuators type **•0T**.

Type **•1T** actuators are always encoded with different codes. This implies that a sensor associated with an actuator type **•1T** can be activated only by a specific actuator. Another **•1T** type actuator will not be recognised by the sensor until a new association procedure is carried out (reprogramming). After reprogramming, the old actuator type **•1T** will no longer be recognized.

Reprogramming of the actuator can be performed repeatedly.

Complete safety system

The use of complete and tested solutions guarantees the electrical compatibility between the sensors of the ST series and the safety modules from Pizzato Elettrica, as well as high reliability. The sensors have been tested with the modules listed in the adjacent table.

Sensors	Compatible safety modules	Safety module output contacts		
		Instantaneous safety contacts	Delayed safety contacts	Signalling contacts
ST D•••••	CS AR-01•024	2NO	/	1NC
	CS AR-02•024	3NO	/	/

	CS MF•••••	see page 121 of the General Catalogue PLCs & Safety Modules 2025–2026		

ST sensors can be used as individual devices provided that the outputs be evaluated by a Pizzato Elettrica safety module (see table for combinable safety modules).

All ST series sensors can be connected, provided that compatibility is checked, to safety modules or safety PLCs with OSSD inputs.

Possibility of series connection of multiple sensors for simplifying the wiring of the safety system, whereby only the outputs of the last sensor are evaluated by a Pizzato Elettrica safety module (see table with compatible safety modules). Each ST sensor is equipped with a signalling output, which – depending on the version – is activated or deactivated when the respective guard is closed. Depending on the specific requirements of the application, this information can be evaluated by a PLC.

Possibility of series connection of multiple sensors for simplifying the wiring of the safety system, whereby only the outputs of the last sensor are evaluated by a Pizzato Elettrica safety module of the CS MP series. Both the safety-relevant evaluation and the evaluation of the signalling outputs are performed by the CS MP series.

Internal wiring diagram (ST D•5••••)

The adjacent diagram illustrates five logical, linked sub-functions of the sensor.

Function f0 is a basic function and includes the monitoring of the power supply as well as internal, cyclical tests.

Function f1 monitors the status of the inputs, whereas function f2 monitors the position of the actuator in the detection area.

Function f3 is intended to activate or deactivate the safety outputs and check for any faults or short circuits in the outputs.

In the EDM versions, function f4 checks the EDM signal on state changes of the safety outputs.

The safety-related function, which combines the sub-functions mentioned above, only activates the safety outputs if the input signals are correctly applied and the actuator is located within the safe zone.

The status of each sub-function is displayed by corresponding LEDs (PWR, IN, ACT, OUT), thereby providing a quick overview of the operating status of the sensor.

LED	Function
ACT	state of actuator / O3 output
IN	status of safety inputs
OUT	status of safety outputs
PWR	Power supply / self-diagnosis

Limit activation zone and safe activation zone (ST D•4••••)

When aligning the sensor with the actuator, the status LEDs use various colours to indicate whether the actuator is in the limit activation zone or in the safe activation zone. The following figures use the ST DD420MK-D1T sensor as an example.

Operating voltage is applied to the sensor, (LED PWR on, green), the inputs are enabled (LED IN on, green), the outputs are deactivated (LED OUT off). The actuator is outside of the actuation zone (LED ACT off).

If the actuator is moved inside the safe activation zone (dark grey area), the ACT LED on the sensor illuminates (green) and it activates the outputs (LED OUT on, green).

When the actuator leaves the safe zone, the sensor keeps the safety outputs enabled. Entry into the limit activation zone (light grey area) is, however, indicated by the ACT LED (orange/green, flashing).

As soon as the actuator exits the limit activation zone, the sensor deactivates the outputs and switches off the OUT and ACT LEDs.

Operating states (ST D•4••••)

PWR LED	OUT LED	IN LED	ACT LED	Sensor state	Description
○	○	○	○	OFF	Sensor off.
●	○	○	○	POWER ON	Internal tests upon activation.
●	*	○	*	RUN	Sensor with inactive inputs.
●	*	●	*	RUN	Activation of the inputs.
●	*	●	*	RUN	Input incoherence. Recommended action: check for presence and/or wiring of inputs.
●	*	*	●	RUN	Actuator in safe area. O3 signalling output active.
●	*	*	●	RUN	Actuator in limit activation zone, O3 active. Recommended action: bring the sensor back to the safe area.
●	●	●	●	RUN	Activation of the inputs. Actuator in safe area and safety outputs active.
●	●	*	*	ERROR	Error on outputs. Recommended action: check for any short circuits between the outputs, outputs and ground or outputs and power supply, then restart the sensor.
●	*	*	*	ERROR	Internal error. Recommended action: restart the sensor. If the failure persists, replace the sensor.

Legend: ○ = off ● = on ● = flashing ● = alternating colours
* = indifferent

O3 output inverted (ST D•6••••, ST D•7••••, ST D•8••••)

The version with inverted O3 signalling output allows checking of the actual electrical connection of the sensor by an external PLC. The O3 output will be activated when the actuator is removed and the OS safety outputs are switched off.

External device monitoring (EDM)

The ST D•51••• version, in addition to maintaining the operating and safety characteristics of the ST series, allows control of **forcibly guided NC contacts of contactors or relays** controlled by the safety outputs of the sensor itself. As an alternative to the relays or contactors you can use Pizzato Elettrica expansion modules CS ME-03. See page

79 of the General Catalogue PLCs & Safety Modules 2025-2026.

This check is carried out by monitoring the EDM input (External Device Monitoring as defined in EN 61496-1) of the sensor.

This version, with the IS safety inputs, **can be used at the end of a series of ST sensors, up to a maximum number of 32 devices**, while maintaining the maximum PL e safety level according to EN ISO 13849-1.

For specific applications, this solution allows you to dispense with the safety module connected to the last device in the chain.

Connection with safety modules

Connections with CS AR-08•••• safety modules

Input configuration with monitored start

2 channels / Category 4 / up to SIL 3 / PL e

Connections with CS AR-05•••• / CS AR-06•••• safety modules

Input configuration with manual start (CS AR-05••••) or monitored start (CS AR-06••••)

2 channels / Category 4 / up to SIL 3 / PL e

Connection with safety module CS MP••••0

The connections vary according to the program of the module

Category 4 / up to SIL 3 / PL e

For application examples, see page 88 of the General Catalogue PLCs & Safety Modules 2025-2026.

A1-A2: supply

IS1-IS2 Safety inputs

OS1-OS2: safety outputs

O3: signalling output

I3: programming input

EDM: input for monitoring of NC contacts of the contactors

Note: Versions with customised pin assignments are available on request.

For female connectors, see page 353.

Series connection

To simplify series connections of the devices, various M12 connectors are available that allow complete wiring.

This solution significantly reduces installation times while at the same time maintaining the maximum safety levels PL e and SIL 3.

For further information see page 361.

Operating distances SM D•T/SM L•T actuators

Operating distances SM E•T actuator

Legend:

Rated operating distance s_n (mm)

Rated release distance s_{nr} (mm)

Note: The progress of the activation areas is for reference only; the possible application on ferromagnetic surfaces can reduce the operating distances.

Introduction

The RFID safety sensors of the ST G - ST H series represent the evolution of the ST D series already known and appreciated by machine builders and users.

The symmetry of the housing allows the same sensor to be used on both left and right doors; by simply rotating the sensor onto itself. The mounting hole spacing (22 mm for the ST G series, 78 mm for the ST H series) was especially realised to perform a technological upgrade of the traditional magnetic sensors of the SR A and SR B series, replacing these with an evolved RFID safety sensor, without changing the machine's mounting hole spacing.

The monolithic housing – free of resins for encapsulation – can be used in even the most aggressive of environments; such as, for example, in the food and pharmaceuticals sector.

Maximum safety with a single device

PL e + SIL 3

The sensors of the ST G - ST H series are constructed with redundant electronics. As a result, the maximum PL e and SIL 3 safety levels can still be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a safety module with OSSD inputs or to a safety PLC.

Actuators with high coding level

The sensors are provided with an electronic system based on RFID technology to detect the actuator. This allows to provide each actuator with different coding and makes it impossible to tamper with a device by using another actuator of the same series. Millions of different coding combinations are possible for the actuators. They are therefore classified as high level coded actuators, according to EN ISO 14119.

Series connection of multiple sensors

One of the most important features of the ST G - ST H series from Pizzato Elettrica is the possibility of connecting up to 32 sensors in series, while still maintaining the maximum safety level (PL e) laid down in EN 13849-1.

This connection type is permissible in safety systems which have a safety module at the end of the chain that monitors the outputs of the last sensor.

The fact that the PL e safety level can be maintained even with 32 sensors connected in series demonstrates the extremely secure structure of each sensor of this series.

Series connection with other devices

The ST G - ST H series features two safety inputs and two safety outputs, which can be connected in series with other Pizzato Elettrica safety devices. This option allows the creation of safety chains containing various devices. For example, stainless steel hinge switches (HX BEE1 series), RFID sensors (ST series) and guard-locking switches (NG or NS series) can be connected in series while still maintaining the maximum PL e and SIL 3 safety levels.

Protection against tampering

Each sensor and actuator is supplied complete with snap-on protection caps to be applied on the holes of the fixing screws. Not only do the caps prevent dirt from accumulating and simplify cleaning, they also block access to the fastening screws of the actuator. As a result, standard screws can be used instead of tamper-proof screws.

Protection degrees IP67 and IP69K

IP69K
IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing. Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Actuation from many directions

The sensors were designed to be activated from various directions, thereby providing the customer with maximum flexibility when positioning the sensors on the guards.

Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Symmetrical housing

Both sensor and actuator are perfectly symmetrical, and can therefore be attached to the machine frame in any orientation.

This feature allows the user to decide the side on which the cable or connector should exit, according to the sensor mounting position,

by simply rotating it into the desired direction; thus eliminating the need to order differently coded products.

Multicolour signalling LED

The ST G - ST H series sensors have a multicolour RGB signalling LED, which, using suitable transparent lenses, can be seen from both sides of the device. This allows fast, immediate diagnostics of the input and output operating states.

This makes it possible to quickly identify the interruption points in the safety chain, active devices, open guards, and any internal device errors – all of which can be identified simply and intuitively.

Insensitivity to dirt and protection of the cable

The sensors are completely sealed and retain their safety characteristics even in the presence of dirt or deposits (not ferromagnetic material). This characteristic, combined with the design without recesses, makes them particularly suitable for use in the food industry. In the versions with cable, this is protected with a gasket located near the output of the switch.

This gasket is also provided with knurling by means of which a corrugated tube can be fastened as cable protection.

Special multitag versions

Special versions of the device are available that have two or more actuators with high coding level, all of which can be recognised by the same sensor. The internal firmware of the sensor can be factory programmed, memorising a different device behaviour for each actuator when the actuator is in front of the sensor.

The multitag function is particularly useful in machines with several work stations, that require various operating modes on the basis of the actuator recognised by the sensor (e.g.: interchangeable machine parts, position of robot, rotary tables, etc.)

Magnetic holding of the actuator

Devices of the ST H series can be ordered with a permanent magnet installed inside the housing, able to generate a holding force between sensor and actuator.

This way, the guard can be kept closed even when there are vibrations or when there is a recoil during the closing stage.

The magnetic holding force can be selected in three different magnitudes to best adapt to any usage situation.

External device monitoring

EDM On request, the switch can be supplied with EDM function (External Device Monitoring). In this case, the switch itself checks the proper function of the devices connected to the safety outputs. These devices (usually relays or safety contactors) must send a feedback signal to the EDM input, which checks that the received signal is consistent with the state of the safety outputs.

Programmability

Programmable sensor versions are available. Here, with a simple and brief operation, the sensor can be programmed to recognise the code of a new actuator.

By activating a special input, the sensor is switched to a safe state, during which it waits for a new code to be accepted. As the actuator approaches, the sensor performs a number of checks on the code being received, whereby the code must adhere to certain parameters of RFID technology.

If the checks are successful, the sensor uses LEDs to signal the successful completion of the procedure.

After programming has been completed, the sensor only recognises the code of the last programmed actuator, thereby preserving the safety level and the reliability of the system in which it is installed.

Versions for mobile applications

10-30V

The RFID safety sensors of the ST H series are now also available in the version with 10-30 V supply voltage, designed for mobile applications where a supply voltage of 12 V is usually available, but also for situations in which the supply voltage is far from the 24 V commonly available in industrial environments.

Extended temperature

Devices with a T8 code extension can be installed in environments with temperatures from -35°C to +85°C and are especially indicated for machines in the food and pharmaceutical sector, allowing to use ST sensors in a broad field of application.

The extended temperature versions are available for both articles with a cable, and those with a stainless steel connector.

Compatible with all SM ••T actuators

Designed for use in conjunction with the SM G•T and SM H•T series actuators, together they form a complete assembly, even from an aesthetic point of view; the ST G and ST H sensors are also compatible with all actuators available for the ST series, with either high or low coding level.

This is particularly useful in applications where the actuator must have specific characteristics; such as, for example, increased activation distance (SM E•T actuators), compact installation dimensions (SM L•T actuators), or fixing holes positioned on two different sides (SM D•T).

Selection table for actuators

								
	Standard actuator		Standard actuator with fixing on 2 levels		Miniaturized actuator		Large actuator	
	low		SM D0T		SM L0T		SM E0T	
	high		SM D1T		SM L1T		SM E1T	

Type •0T actuators are all encoded with the same code. This implies that a sensor associated with an actuator type •0T can be activated by other actuators type •0T.

Type •1T actuators are always encoded with different codes. This implies that a sensor associated with an actuator type •1T can be activated only by a specific actuator. Another •1T type actuator will not be recognised by the sensor until a new association procedure is carried out (reprogramming). After reprogramming, the old actuator type •1T will no longer be recognized.

Reprogramming of the actuator can be performed repeatedly.

Operating states

The multicolour signalling LED, which can be seen from both sides of the device, provides easy and intuitive verification of sensor operating state.

GREEN LED
Normal operating state, with actuator inside detection zone, safety inputs activated (when present), safety outputs activated.

YELLOW LED
Normal operating state, with actuator outside detection zone.

RED LED
Error state: the error type is indicated to the user via LED illumination sequences and colour variations.

PURPLE LED
Programming state during new actuator identification procedure.

Internal operating wiring diagram

The adjacent diagram illustrates five logical, linked sub-functions of the sensor.

Function f0 is a basic function and includes the monitoring of the power supply as well as internal, cyclical tests.

Function f1 monitors the status of the inputs, whereas function f2 monitors the position of the actuator in the detection area.

Function f3 is intended to activate or deactivate the safety outputs and check for any faults or short circuits in the outputs.

The f4 function verifies the coherence of the EDM signal during safety output state changes (in versions with EDM input), or monitors the activation state of the programming input, activating the actuator replacement procedure (in versions with I3 programming input).

The safety-related function, which combines the sub-functions mentioned above, only activates the safety outputs if the input signals are correctly applied and the actuator is located within the safe zone.

The state of each function is displayed via signalling LED illumination and colour change. This immediately communicates the overall sensor state to the operator.

Limit activation zone and safe activation zone

When aligning the sensor with the actuator, the multicolour signalling LED changes colour to indicate to the operator whether the actuator is in the limit activation zone or in the safe activation zone.

The sensor has power, the inputs are enabled, the outputs are disabled. The actuator is outside of the actuation zone. The LED is illuminated constant yellow.

If the actuator is moved inside the safe activation zone (dark grey area), the sensor activates the outputs. The LED is illuminated constant green.

When the actuator leaves the safe zone, the sensor keeps the safety outputs enabled. Entry into the limit activation zone (light grey area) is, however, indicated by the yellow LED flashing intermittently.

When the actuator leaves the limit activation zone, the sensor disables the outputs. The signalling LED illuminates again constant yellow.

Operating distances for SM G•T, SM H•T, SM D•T, SM L•T actuators

Operating distances for SM E•T actuators

Legend:

Rated operating distance s_n (mm)

Rated release distance s_{nr} (mm)

Note: The progress of the activation areas is for reference only; the possible application on ferromagnetic surfaces can reduce the operating distances.

Complete safety system

The use of complete and tested solutions guarantees the electrical compatibility between the sensors of the ST series and the safety modules from Pizzato Elettrica, as well as high reliability. The sensors have been tested with the modules listed in the adjacent table.

ST sensors can be used as individual devices provided that the outputs be evaluated by a Pizzato Elettrica safety module (see table for compatible safety modules).

Sensors	Compatible safety modules	Safety module output contacts		
		Instantaneous safety contacts	Delayed safety contacts	Signalling contacts
ST G..... ST H.....	CS AR-01•024	2NO	/	1NC
	CS AR-02•024	3NO	/	/
	CS AR-05•024	3NO	/	1NC
	CS AR-06•024	3NO	/	1NC
	CS AR-08•024	2NO	/	/
	CS AT-0••024	2NO	2NO	1NC
	CS AT-1••024	3NO	2NO	/
	CS MP.....	see page 89 of the General Catalogue PLCs & Safety Modules 2025–2026		
	CS MF.....	see page 121 of the General Catalogue PLCs & Safety Modules 2025–2026		

All ST series sensors can be connected, provided that compatibility is checked, to safety modules or safety PLCs with OSSD inputs.

Series connection with safety modules

Multiple ST series sensors can be **connected in series**, so as to simplify the safety system wiring. In this configuration, the safety outputs of the last sensor in the chain must be evaluated by a Pizzato Elettrica CS series safety module (see table for compatible safety modules).

Each ST sensor is additionally equipped with a **signalling output**, which – depending on the version – is activated or deactivated when the respective guard is closed. This information can be managed – according to the specific requirements of the implemented system – by a PLC or by a Pizzato Elettrica CS MP series safety module, which allows control of both safety and signalling outputs.

Connection with safety module and PLC

Connection with programmable safety module

External device monitoring (EDM)

The ST ••5•••• and ST ••9•••• versions, in addition to maintaining the operating and safety characteristics of the ST series, allow control of **forcibly guided NC contacts of contactors or relays** controlled by the safety outputs of the sensor itself. This check is carried out by monitoring the EDM input (External Device Monitoring as defined in EN 61496-1) of the sensor.

As an alternative to the relays or contactors you can use Pizzato Elettrica expansion modules CS ME-03. See page 79 of the General Catalogue PLCs & Safety Modules 2025-2026.

The EDM version, which is equipped with the IS safety inputs, **can be used at the end of a series** of ST sensors, **up to a maximum number of 32 devices**, while maintaining the maximum PL e safety level according to EN 13849-1.

For specific applications, this solution allows you to dispense with the safety module connected to the last device in the chain.

O3 output inverted

Using versions with inverted O3 signalling output (articles ST ••6••••, ST ••7••••, ST ••8••••, ST ••9••••) allows checking of the actual electrical connection of the sensor by an external PLC. The O3 output will be activated when the actuator is removed and the OS safety outputs are switched off.

Connection with safety modules

Connections with CS AR-08•••• safety modules

Input configuration with monitored start

2 channels / Category 4 / up to SIL 3 / PL e

Connections with CS AT-0••••• / CS AT-1••••• safety modules

Input configuration with monitored start

2 channels / Category 4 / up to SIL 3 / PL e

For features of the safety modules see page 15 of the General Catalogue PLCs & Safety Modules 2025-2026.

Connections with CS AR-05••••• / CS AR-06••••• safety modules

Input configuration with manual start (CS AR-05•••••) or monitored start (CS AR-06•••••)

2 channels / Category 4 / up to SIL 3 / PL e

Connection with safety module CS MP•••••0

The connections vary according to the program of the module

Category 4 / up to SIL 3 / PL e

For application examples, see page 88 of the General Catalogue PLCs & Safety Modules 2025-2026.

Series connection

To simplify series connections of the devices, various M12 connectors are available that allow complete wiring.

This solution significantly reduces installation times while at the same time maintaining the maximum safety levels PL e and SIL 3.

For more information see page 361.

Multitag function

This version of the device is supplied with two or more actuators with high coding level, all of which can be acknowledged by the same sensor. The internal firmware of the sensor can be factory programmed, memorising up to 16 actuators and associating a different device behaviour to each of the same once the actuator has been acknowledged by the sensor.

The new multitag function lets you activate or deactivate the sensor outputs, and also send the information on which actuator is in front of the sensor, using a serial signal via the O3 signalling output. This signal can be sent and processed by a PLC.

Programming code	Number of actuators	Programming
P1	2 x SM G1T	TAG0 activates the OS safety outputs TAG1 activates the O3 signalling output
P2	2 x SM G1T	TAG0 activates the OS safety outputs and sends "0" to O3 TAG1 activates the OS safety outputs and sends "1" to O3
P3	3 x SM G1T	TAG0 activates the OS safety outputs and sends "0" to O3 TAG1 activates the OS safety outputs and sends "1" to O3 TAG2 activates the OS safety outputs and sends "2" to O3
P4	4 x SM G1T	TAG0 activates the OS safety outputs and sends "0" to O3 TAG1 activates the OS safety outputs and sends "1" to O3 TAG2 activates the OS safety outputs and sends "2" to O3 TAG3 activates the OS safety outputs and sends "3" to O3

Note: The actuators are supplied with an indelible laser-engraved ID code.

Other programming options are available on request.
Contact technical support for more information.

Attention! As required by EN ISO 14119 to be used in safety applications, all the actuators must be fixed immovably on the machine, and none of them can be used as a bypass to activate the device.

Application example for ST G.....P1 articles

Article ST G.....P1 has a sensor with two actuators.

Compared to a traditional configuration with one single actuator, the device is able to not only recognise "guard closed" status through actuator 0 (in this case activating the OS safety outputs), but also "guard fully open" status, through actuator 1, which activates signalling output O3.

By sending this information to the machine control logic you can eliminate uncertainties caused by incomplete guard opening, increasing the precision and intrinsic safety of the machine.

This device is typically used on a press or any automatic machine in general, which uses a robot to load and unload workpieces if you want the robot to operate only when the guard is fully open.

Application example for ST G.....P4 articles

Article ST G.....P4 has a sensor with four actuators.

On a rotary table assembly station, the ST G sensor can be installed in combination with as many actuators as the available work stations (4 in the example shown).

When recognised by the sensor, each actuator activates the OS safety outputs and sends a string of bits with its ID code ("0" for TAG0, "1" for TAG1, up to "F" for TAG15, according to hexadecimal numbering). In this way, in every situation you can know which is the active work station, for example in the machine start-up phase or after an unexpected blackout.

The device has been designed for processing and assembly plants with multiple stations, robotised islands and machining centres.

Transmission protocol on signalling output O3

The articles with multitag programming (in the special versions) can transmit an actuator identification code with a serial signal sent through the O3 signalling output when the actuator is in front of the sensor.

The information is sent in a sequence of bits (0, 1) which represents the ASCII code of the hexadecimal number associated with the actuator (TAG0 = 0, TAG1 = 1 ... TAG9 = 9, TAG10 = A ... TAG15 = F). 8 bits are required for each TAG to complete the transmission.

For example, ID code "0" of the first actuator is sent by the sensor as a sequence of the following bits:

00110000 (ASCII code: "zero" digit)

The start bit is used at the beginning of the sequence to signal the start of the transmission, while the network goes into a rest state at the end of the transmission (network idle low or equal to 0, no stop bit) for a pre-set interval of time.

All you need is a PLC with a program that can code the O3 input transmission, to process the information so it can be used in the machine control logic.

Transmission parameters		
A	Coding type:	serial
B	Bit duration:	20 ms
C	Byte length:	160 ms (8 bit)
D	Interval:	200 ms
E	Network idle:	low
F	Start bit:	1
G	Stop bit:	none

Accessories

Article	Description
VS SP5CA1	Polyurethane foam adhesive strip for SM H•T actuators

Protective polyurethane foam strip, with adhesive, applicable on SM H•T actuators, reduces noise and force in case of impact between sensor and actuator.

Article	Description
SM H9ZF	Door holding magnet (holding force 40 N)
SM H9ZQ	Door holding magnet (holding force 40 N, opposite polarity to SM H9ZF)

Holding magnets for use on machinery doors. The magnets are sealed inside a plastic cover and will not rust even in damp environments.

Description

The HP - HC series hinge switches from Pizzato Elettrica combine safety and style in a single product. The electric switch is fully integrated into the mechanical hinge so that it is virtually invisible to an inexperienced eye. This, besides from being an aesthetic advantage, guarantees greater safety as a switch which is difficult to identify is consequently even more difficult to tamper with. The rear mounting without screws in sight and the very precise line mean the switch can be perfectly integrated even with guards of machinery with a very precise design. Complementary hinges with purely mechanical functions are also available to ensure perfect alignment with the rest of the machine.

Adjustment of the switching point

The switching point of the switches can be set with a screwdriver. Adjusting the switching point allows for any calibration for large size guards. After calibrating the switch, it is always necessary to close the hole using the safety cap supplied.

Basic activation angle variants

On request, versions with a switch activation angle of 15° multiples (e.g. 45° or 90°) are available. The different activation angle does not exclude the possibility of adjustment of the switching point by means of the adjustment screw in the switch. Any change in the operating angle clearly does not alter the maximum mechanical switch travel.

Integrated M12 connector

Versions with connection from the top or the bottom are available with integrated M12 connector. The use of versions with connectors permits faster wiring if guards need to be moved from the test location to the installation site.

Opening angle up to 180°

The mechanical design of the switch also allows use on guards with an opening angle of up to 180°.

Cable with connector at the back

The version with a rear cable and M12 connector is the best combination between aesthetics and connection ease. If machines need to be assembled at the customer's site, this solution allows the wiring to be hidden. At the same time, it facilitates the connection and disconnection of the wiring from inside the machinery.

Versions for glass or polycarbonate doors

A version of the switch developed exclusively for glass and polycarbonate doors without frame is available. Installation is facilitated by the larger supporting arm and the spaced fixing points; these also prevent the formation of cracks caused by holes located too close to the edge of the guard. It is necessary to verify that the switch is not used as a mechanical stop for the door.

Protection degrees IP67 and IP69K

IP69K
IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Additional hinges

To complete the installation, various types of additional hinges are available to be used in a variable number depending on the weight of the guard.

These hinges have the same aesthetic but cost less as they contain no electrical parts.

Application examples

- Switch without mounting plate.
- Rear fixing.
- Cable output at the back.

- Switch with angular mounting plate for slotted profile.
- Fixing with internal screws.
- Output with M12 connector at the bottom.

- Switch with straight mounting plate for front slotted profile.
- Fixing with screws at the back.
- Cable output at the bottom.

Closed door

- Direct fixing to the polycarbonate plate.
- Switch without mounting plate.
- Fixing with internal screws.
- Output with connector at the back.

Utilization category:	AC15 / DC13 (with connector)
Operating voltage (U_o):	250 Vac (50 Hz) / 24 Vdc (with connector)
Operating current (I_o):	3 A / 2 A (with connector)

Forms of the contact element: X, Y, Zb, X+X, Y+Y, Y+Y+X, X+X+Y, X+X+Y+Y
 Positive opening contacts on contact blocks 50A, 50C, 50D, 50F, 50G, 50M, 51A, 51C, 51D, 51F, 51G, 51M, 52A, 52C, 52D, 52F, 52G, 52M, 53A, 53C, 53D, 53F, 53G, 53M

In compliance with standards: EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU.

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings:	R300 pilot duty (28 VA, 125-250 Vdc) B300 pilot duty (360 VA, 120-240 Vac) (1-2-3 cont.) C300 pilot duty (180 VA, 120-240 Vac) (4 cont.) 24 Vac, Class 2, 2 A pilot duty (M12 connector) 24 Vdc, Class 2, 0.22 A pilot duty (M12 connector)
Environmental Ratings:	Type 1

Description

The HX series hinge switches from Pizzato Elettrica combine safety and style in a single product.

The electric switch is fully integrated into the mechanical hinge so that it is virtually invisible to an inexperienced eye. This, besides from being an aesthetic advantage, guarantees greater safety as a switch which is difficult to identify is consequently even more difficult to tamper with. The rear mounting without screws in sight and the very precise line mean the switch can be perfectly integrated even with guards of machinery with a very precise design.

As the HX series safety hinge switches are in stainless steel, they can be used in environments where particular attention must be paid to hygiene making them suitable for a variety of applications, ranging from the food and pharmaceutical sectors to the chemical and marine sectors.

Maximum safety with a single device

PL e + SIL 3

The HX BEE1 series hinge switches are constructed with redundant electronics. As a result, the maximum PL e and SIL 3, safety levels can still be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a module suitable for managing devices with semiconductor outputs, or to a safety PLC.

Series connection of several switches

PL e + SIL 3

One of the most important features of the HX series is the possibility of connecting up to 32 sensors in series, while still maintaining the maximum safety levels PL e laid down in EN 13849-1 and SIL 3 acc. to EN IEC 62061.

This connection type is permissible in safety systems which have a safety module at the end of the chain that monitors the outputs of the last HX switch.

The fact that the PL e safety level can be maintained even with 32 sensors connected in series demonstrates the extremely secure structure of each single device.

Series connection with other devices

PL e + SIL 3

The HX BEE1 series hinge switch features two safety inputs and two safety outputs, which can be connected in series with other Pizzato Elettrica safety devices. This option allows the creation of safety chains containing various devices. For example, stainless steel safety hinges (HX BEE1 series), transponder sensors (ST series) and door lock sensors (NG series) can be connected in series while still maintaining the maximum PL e and SIL 3 safety levels.

Adjustment of the switching point

The switching point of the switches can be set with a screwdriver.

Adjusting the switching point allows for any calibration for large size guards. After calibrating the switch, it is always necessary to close the hole using the safety cap supplied.

Basic activation angle variants

On request, versions with a switch base activation angle of 15° multiples (e.g. 45° or 90°) are available.

The different activation angle does not exclude the possibility of fine adjustment of the switching point by means of the adjustment screw in the switch. Any change in the base operating angle does not alter the maximum mechanical switch travel.

Cable with connector at the back

The version with a cable with M12 connector at the back offers the best combination of aesthetics and simple connection.

This solution allows the wiring to be hidden. At the same time, it facilitates the connection and disconnection of the wiring from inside the machinery.

Opening angle up to 180°

The mechanical design of the switch also allows use on guards with an opening angle of up to 180°.

Protection degrees IP67 and IP69K

IP69K IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing. Due to

their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Materials

AISI 316L

With this new series in AISI316L stainless steel, Pizzato Elettrica offers an extensive range of devices suitable for environments where special attention must be paid to cleanliness and hygiene.

The accurate surface finish allows these devices to be used for a variety of applications, ranging from the food and pharmaceutical sectors to the chemical and marine sectors.

Additional hinges

To complete the installation, various types of additional hinges are available to be used in a variable number depending on the weight of the guard.

These hinges have the same aesthetic and mechanical structure but cost less as they contain no electrical parts.

Laser engraving

Pizzato Elettrica has introduced a new laser engraving system for stainless steel switches of the HX series.

Thanks to this new system, engravings on the products are indelible.

For heavy duty applications

Specially designed for heavy industrial applications, these hinges are made of high-thickness microfusion materials with high strength mechanical properties. The maximum loads indicated in the technical specifications are those that the hinge can withstand without any lubrication, for one million opening and closing cycles, while

maintaining its features as a safety device in perfect efficiency.

Mechanical or electronic contact blocks

Internally equipped with innovative concepts, the HX series safety switches can be supplied both with electromechanical safety contacts with positive opening, or with self monitoring redundant electronic safety outputs. This allows the customer to choose between the most cost-effective solution (mechanical contacts) or a maximum security solution (electronic outputs).

With cable or connector

The electrical connection via integrated cable or M12 connector option makes the device suitable for the most diverse applications. The connector versions allow faster device replacement and installation, by making incorrect wiring connection impossible. The cable versions, on the other hand, offer the best value for money. Both the cable as well as the connector versions are available with mechanical or electronic contact blocks.

Four LEDs for immediate diagnosis

The versions with electronic contact block are equipped with four signalling LEDs. Each LED represents a specific hinge function, this greatly facilitates switching point adjustment via the immediate visual indication for the installer during the adjustment phase. There are also three separate LEDs available: one for input status, one for output status, and one for general device status. For serial applications,

this independence enables identification of any interruptions in the safety chain and of any internal errors. All of this at a glance, without needing to decode complex flashing sequences.

Three different output directions

Designed for flexibility, the HX series safety hinges are equipped with three different output directions for the electrical conductors. Directions from below or from above allow the same exit direction of the conductor to be maintained, both for right and for left-hand doors. The direction from behind has the ultimate aesthetic, cleanliness and hygiene result. All three electrical output directions are available with output cables in various lengths or with M12 connector.

Gold-plated contacts

The contact blocks of these devices can be supplied gold-plated upon request. Ideal for applications with low voltages or currents; it ensures increased contact reliability. The high-thickness coating > 1 micron ensures the mechanical endurance of the coating over time.

Housing

Metal housing, polished, AISI 316L stainless steel
Versions with integrated cable, length 2 m, other lengths from 0.5 ... 10 m on request
Versions with integrated M12 connector
Versions with M12 connector and 0.2 m cable, other lengths from 0.1 ... 3 m on request
Protection degree:

IP67 acc. to EN 60529
IP69K acc. to ISO 20653 (Protect the cables from direct high-pressure and high-temperature jets)
> 1000 hours in NSS acc. to ISO 9227

Corrosion resistance in saline mist:

General data

"Maximum SIL" up to: SIL 3 acc. to EN IEC 62061
Performance Level (PL) up to: PL e acc. to EN ISO 13849-1
Mechanical interlock, not coded: type 1 acc. to EN ISO 14119
Safety parameters HX B•22-...
B_{10D}: 5,000,000 for NC contacts
Safety parameters HX BEE1-...
MTTF_D: 2413 years
PFH_D: 1.24E-09
DC: High
Mission time: 20 years
Ambient temperature: see table on page 80
Max. actuation frequency: 600 operating cycles/hour
Mechanical endurance: 1 million operating cycles
Max. actuation speed: 90°/s
Min. actuation speed: 2°/s
Mounting position: any
Tightening torque, M6 screws: 10 ... 12 Nm

Electrical data (L22 - H22 mechanical contact blocks)

Rated impulse withstand voltage U_{imp}: 4 kV
Conditional short circuit current: 1000 A acc. to EN 60947-5-1
Pollution degree: 3

Electrical data (EE1 electronic contact block)

Rated operating voltage U_e: 24 Vdc (-15%...+10%) SELV/PELV
Consumption at voltage U_e: < 1W
Rated impulse withstand voltage U_{imp}: 1.5 kV
Resettable internal protection fuse: 1.1 A
Overvoltage category: III
IS1/IS2 safety inputs
Rated operating voltage U_e: 24 Vdc
Rated current consumption: 5 mA
OS1/OS2 safety outputs
Rated operating voltage U_e: 24 Vdc
Output type: PNP type OSSD
Utilisation category: DC13; U_e=24 Vdc; I_e=0.25 A
Short circuit detection: Yes
Overcurrent protection: Yes
Duration of the deactivation impulses at the safety outputs: < 300 us
Permissible capacitance between outputs: < 200 nF
Permissible capacitance between output and ground: < 200 nF
O3 signalling output
Rated operating voltage U_e: 24 Vdc
Output type: PNP
Utilisation category: DC13; U_e=24 Vdc; I_e=0.1 A
Short circuit detection: No
Overcurrent protection: Yes

⚠ If not expressly indicated in this chapter, for correct installation and utilization of all articles see chapter Utilization requirements from page 379 to page 394.

⚠ Important: Switch off the circuit voltage before disconnecting the connector from the switch. The connector is not suitable for separation of electrical loads. According to EN 60204-1, versions with 8-pole M12 connector can be used only in SELV circuits.

Features approved by UL

Electrical Ratings: R300 pilot duty (28 VA, 125-250 Vdc)
C300 pilot duty (180 VA, 120-240 Vac)
24 Vac, Class 2, 2 A pilot duty (M12 connector)
24 Vdc, Class 2, 0.22 A pilot duty (M12 connector)
24 Vdc / 0.25 A (electronic version)
Environmental Ratings: Types 1, 4X, 6, 12, 13

Features approved by TÜV SÜD

Max. actuation frequency: 600 operating cycles/hour
Mechanical endurance: 1 million operating cycles
Response time to deactivation of contacts/inputs: maximum 12 ms
PL, category: PL e, category 4
In compliance with standards: IEC 61508-1:2010 (SIL 3), IEC 61508-2:2010 (SIL 3), IEC 61508-3:2010 (SIL 3), EN IEC 62061:2021, EN ISO 13849-1:2015 (PL e, Cat. 4), EN 60947-5-1:2017/AC:2020, EN ISO 14119:2013

Complete safety system

The use of complete and tested solutions guarantees the electrical compatibility between the hinge of the HX series and the safety modules from Pizzato Elettrica, as well as high reliability. The sensors have been tested with the modules listed in the adjacent table.

Switches	Compatible safety modules	Safety module output contacts		
		Instantaneous safety contacts	Delayed safety contacts	Signalling contacts
HX BEE1-...	CS AR-01•024	2NO	/	1NC
	CS AR-02•024	3NO	/	/
	CS AR-05•024	3NO	/	1NC
	CS AR-06•024	3NO	/	1NC
	CS AR-08•024	2NO	/	/
	CS AT-0•024	2NO	2NO	1NC
	CS AT-1•024	3NO	2NO	/
	CS MP•.....	see page 89 of the General Catalogue PLCs & Safety Modules 2025–2026		
	CS MF•.....	see page 121 of the General Catalogue PLCs & Safety Modules 2025–2026		

The hinges with HX BEE1-... electronic contact block can be connected to safety modules or safety PLCs with OSSD inputs provided compatibility is ensured in advance.

Possibility of series connection of multiple hinges for simplifying the wiring of the safety system, whereby only the outputs of the last hinge are evaluated by a Pizzato Elettrica safety module (see table with compatible safety modules). Each HX switch is provided with a signalling output, which is activated when the respective guard is closed. Depending on the specific requirements of the application, this information can be evaluated by a PLC.

Possibility of series connection of multiple hinges for simplifying the wiring of the safety system, whereby only the outputs of the last hinge are evaluated by a Pizzato Elettrica safety module of the CS MP series. Both the safety-relevant evaluation and the evaluation of the signalling outputs are performed by the CS MP series.

Internal wiring diagram

The adjacent diagram illustrates 4 logical, linked sub-functions of the hinge switch.

Function f0 is a basic function and includes the monitoring of the power supply as well as internal, cyclical tests.

The task of function f1 is to evaluate the status of the device inputs, whereas function f2 checks the opening of the guard. Function f3 is intended to activate or deactivate the safety outputs and check for any faults or short circuits in the outputs.

The safety-related function, which combines the sub-functions mentioned above, only activates the safety outputs if the input signals are correctly applied and the guard is in closed position.

The status of each function is displayed by the corresponding LED (PWR, IN, ACT, LOCK, OUT), in such a way that the general device status becomes immediately obvious to the operator.

LED	Function
ACT	state of actuator / O3 output
IN	status of safety inputs
OUT	status of safety outputs
PWR	Power supply / self-diagnosis

Series connection

To simplify series connections of the devices, various M12 connectors are available that allow complete wiring.

This solution significantly reduces installation times while at the same time maintaining the maximum safety levels PL e and SIL 3.

For further information see page 361.

Accessories

Article	Description
VF AC7032	Protection cap of adjustment screw

The cap is supplied with every hinge and must always be attached after the fine adjustment of the switching point.

In case of loss or damage, the cap can be ordered separately.

Fixing plates

Article	Description
VF SFH10-TX	Couple of stainless steel plane plates supplied with fastening screws for attachment of the switch.

Article	Description
VF SFH9	Polyethylene gaskets for the food industry. Seals the contact surface between the hinge and the frame.

Article	Description
VF SFH8	Mobile part cover in stainless steel. Ideal for fixing the mobile part with polycarbonate guards.

Max. forces and loads HX

Admitted max. loads, independent of utilization conditions.

Attention: Never exceed the loads listed above under any circumstances.

The loads have been verified by a fatigue test of one million operating cycles with a 90° opening angle.

Doors with one safety hinge
 $F_{max}(N)=50,000/D(mm)$

Doors with one safety hinge and one additional hinge
 $F_{max}(N)=400,000/D(mm)$

Doors with one safety hinge and two additional hinges
 $F_{max}(N)=500,000/D(mm)$

Legend

F_{max}	Force exerted by the weight of the door (N)
D	Distance from the centre of gravity of the door to the axis of the hinge (mm)
A	Safety hinge
B	Additional hinge

All values in the drawings are in mm

Accessories See page 353

Description

These safety switches are designed to monitor gates or guards that safeguard dangerous parts of machines without inertia. They are very sensitive, open the contacts after few degrees of rotation and immediately send the stop signal. The head, which can be turned in 90° steps, enables installation in multiple positions.

The metal housing and the stainless steel actuator enable use even under operating conditions in which dust and dirt could inhibit the operation of normal safety switches with separate actuator.

Heads with variable orientation

For all switches, the head can be adjusted in 90° steps after removing the four fastening screws. This allows you to use the same switch on both right- and left-facing door fronts.

Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Protection degree IP67

IP67 These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Application examples

Safety switches for hinges, mounting on double door

Safety switch for hinges, mounting outside the safety guard

Adjustable switching point

When installing the device, the contact switching point can be adjusted over the entire 360° range. By fixing the stud screw, it is possible to check the correct setting of the activation angle and quickly and easily adjust it if necessary. Once adjustment is complete, you can render the device tamper-proof against commonly used tools using the supplied lock pin.

Features approved by IMQ

Rated insulation voltage (U _i):	500 Vac 400 Vac (for contact blocks 2, 11, 12, 20, 21, 22, 28, 29, 30, 33, 34, 37)

How to read travel diagrams

All values in the diagrams are in degrees

IMPORTANT:

In **safety applications**, actuate the switch **at least up to the positive opening travel** shown in the travel diagrams with symbol . Actuate the switch **at least with the positive opening force**, reported in brackets below each article, next to the actuating force value.

All values in the drawings are in mm

Accessories See page 353

→ The 2D and 3D files are available at www.pizzato.com

Adjustment of the switching point

Temporary locking of the actuator
(stud screw provided).

Verify the switching point according to EN ISO 13857
and recalibrate if necessary.

Pin the switch (pin is provided).

Main features

- Metal housing or technopolymer housing, from one to two conduit entries
- Hinged cover, fixed with single captive screw (FR, FM, FK, FX)
- Metal plates on mounting holes of the housing (FR, FX, FK)
- Protection degrees IP67 and IP69K
- 12 contact blocks available
- Versions with M12 connector
- Versions with gold-plated silver contacts
- Versions with stainless steel external metallic parts

Technical data

Housing

FR, FX and FK series housing made of glass fibre reinforced technopolymer, self-extinguishing, shock-proof and with double insulation:

FM series metal housing, baked powder coating.

FR, FM, FK series: one threaded conduit entry: M20x1.5 (standard)

FX series: two knock-out threaded conduit entries: M20x1.5 (standard)

Protection degree (FR, FM, FK, FX): IP67 acc. to EN 60529 (with cable gland of equal or higher protection degree)

IP69K acc. to ISO 20653 (cable gland of equal or higher protection degree)

General data

"Maximum SIL" up to: SIL 3 acc. to EN IEC 62061

Performance Level (PL) up to: PL e acc. to EN ISO 13849-1

Mechanical interlock, not coded: type 1 acc. to EN ISO 14119

Safety parameters:

B_{10D} : 5,000,000 for NC contacts

Mission time: 20 years

Ambient temperature: -25°C ... +80°C (standard)

-40°C ... +80°C (T6 option)

Max. actuation frequency: 3600 operating cycles/hour

Mechanical endurance: 1 million operating cycles

Max. actuation speed: 180°/s

Min. actuation speed: 2°/s

Tightening torques for installation: see page 383

Wire cross-sections and wire stripping lengths: see page 401

In compliance with standards:

IEC 60947-5-1, IEC 60947-1, IEC 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN IEC 63000, UL 508, CSA C22.2 No. 14.

Approvals:

EN 60947-5-1, UL 508, CSA C22.2 No. 14, GB/T14048.5

Compliance with the requirements of:

Machinery Directive 2006/42/EC, EMC Directive 2014/30/EU,

RoHS Directive 2011/65/EU.

Positive contact opening in conformity with standards:

IEC 60947-5-1, EN 60947-5-1.

If not expressly indicated in this chapter, for correct installation and utilization of all articles see chapter Utilization requirements from page 379 to page 394.

Description

These safety switches are designed to monitor gates or guards that safeguard dangerous parts of machines without inertia. They are very sensitive, open the contacts after few degrees of rotation and immediately send the stop signal. The head, which can be turned in 90° steps, enables installation in multiple positions. Available with technopolymer or metal housings, with protection degree IP67. The special design allows it to be used even under operating conditions in which dust and dirt could inhibit the operation of normal safety switches with separate actuator.

Heads with variable orientation

For all switches, the head can be adjusted in 90° steps after removing the four fastening screws. This allows you to use the same switch on both right- and left-facing door fronts.

Protection degrees IP67 and IP69K

IP69K
IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test according to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Application examples

Safety switches for hinges, mounting on double door

Safety switch for hinges, mounting outside the safety guard

Adjustable switching point

When installing the device, the contact switching point can be adjusted over the entire 360° range. By fixing the stud screw, it is possible to check the correct setting of the activation angle and quickly and easily adjust it if necessary. Once adjustment is complete, you can render the device tamper-proof against commonly used tools using the supplied lock pin.

Features approved by IMQ

Rated insulation voltage (U _i):	500 Vac 400 Vac (for contact blocks 2, 11, 12, 20, 21, 22, 28, 29, 30, 37, 33, 34)
Conventional free air thermal current (I _{th}):	10 A
Protection against short circuits:	type aM fuse 10 A 500 V
Rated impulse withstand voltage (U _{imp}):	6 kV 4 kV (for contact blocks 20, 21, 22, 28, 29, 30, 33, 34)
Protection degree of the housing:	IP67
MV terminals (screw terminals)	3
Pollution degree:	AC15
Utilization category:	400 Vac (50 Hz)
Operating voltage (U _e):	3 A
Operating current (I _e):	
Forms of the contact element:	Za, Za+Za, X+X, Zb, Y+Y, Y+Y+X, Y+Y+Y, Y+X+X, Y, X.
Positive opening of contacts on contact blocks	5, 6, 7, 8, 9, 11, 13, 14, 16, 17, 18, 19, 20, 21, 22, 28, 29, 30, 33, 34, 37, 38, 39, 66.
In compliance with standards:	EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU.

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings:	Q300 pilot duty (69 VA, 125-250 V dc) A600 pilot duty (720 VA, 120-600 V ac)
Environmental Ratings:	FR: Types 1, 4X FM, FX, FK: Types 1, 4X, 12, 13
Use 60 or 75 °C copper (Cu) conductor and wire size range 12, 14 AWG, stranded or solid. The terminal tightening torque of 7.1 lb in (0.8 Nm).	
For FR, FX, FK series: the hub is to be connected to the conduit before the hub is connected to the enclosure.	

Please contact our technical department for the list of approved products.

Description

These safety switches are used to control gates or guards with hinges protecting dangerous parts of machines without inertia. Easy to install, they do not need the interaction with the hinge of the guard. They are very sensitive, open the contacts after few degrees of rotation and immediately send the stop signal.

Heads with variable orientation

For all switches, the head can be adjusted in 90° steps after removing the four fastening screws. This allows you to use the same switch on both right- and left-facing door fronts.

Application examples

Safety switch with slotted hole lever, mounting inside the safety guard

Safety switch with slotted hole lever, mounting on guards which open up to 180°

Protection degree IP67

IP67 These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Technical data

Housing

FP series housing made of glass fibre reinforced technopolymer, self-extinguishing, shock-proof and with double insulation: 
 FD series: metal housing, baked powder coating.
 One threaded conduit entry: M20x1.5 (standard)
 Protection degree: IP67 acc. to EN 60529 with cable gland of equal or higher protection degree

General data

"Maximum SIL" up to: SIL 3 acc. to EN IEC 62061
 Performance Level (PL) up to: PL e acc. to EN ISO 13849-1
 Interlock with mechanical lock, coded: type 2 acc. to EN ISO 14119
 Coding level: low acc. to EN ISO 14119
 Safety parameters:
 B_{10D}: 1,000,000 for NC contacts
 Mission time: 20 years
 Ambient temperature: -25°C ... +80°C (standard)
 -40°C ... +80°C (T6 option)
 Max. actuation frequency: 360 operating cycles/hour
 Mechanical endurance: 500,000 operating cycles
 Max. actuation speed: 0.5 m/s
 Min. actuation speed: 1 mm/s
 Maximum force before breakage F_{TEST}: 1000 N acc. to EN ISO 14119
 Max. holding force F_{ZH}: 770 N acc. to EN ISO 14119
 Max. clearance of the actuator: 4.5 mm
 Tightening torques for installation: see page 381
 Wire cross-sections and wire stripping lengths: see page 401

In compliance with standards:

IEC 60947-5-1, IEC 60947-1, IEC 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN IEC 63000, BG-GS-ET-15, UL 508, CSA C22.2 No. 14.

Approvals:

EN 60947-5-1, UL 508, CSA C22.2 No. 14, GB/T14048.5

Compliance with the requirements of:

Machinery Directive 2006/42/EC, EMC Directive 2014/30/EU, RoHS Directive 2011/65/EU.

Positive contact opening in conformity with standards:

IEC 60947-5-1, EN 60947-5-1.

⚠ If not expressly indicated in this chapter, for correct installation and utilization of all articles see chapter Utilization requirements from page 379 to page 394.

Conventional free air thermal current (I _{th}):	10 A
Protection against short circuits:	type aM fuse 10 A 500 V
Rated impulse withstand voltage (U _{imp}):	6 kV 4 kV (for contact blocks 20, 21, 22, 28, 29, 30, 33, 34)
Protection degree of the housing:	IP67
MV terminals (screw terminals)	
Pollution degree:	3
Utilization category:	AC15
Operating voltage (U _e):	400 Vac (50 Hz)
Operating current (I _e):	3 A
Forms of the contact element: Za, Za+Za, X+X, Zb, Y+Y, Y+Y+X, Y+Y+Y, Y+X+X, Y, X.	
Positive opening of contacts on contact blocks 5, 6, 7, 8, 9, 11, 13, 14, 16, 17, 18, 19, 20, 21, 22, 28, 29, 30, 33, 34, 37, 38, 39, 66.	
In compliance with standards: EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU.	

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings:	Q300 pilot duty (69 VA, 125-250 V dc) A600 pilot duty (720 VA, 120-600 V ac)
Environmental Ratings:	Types 1, 4X, 12, 13
Use 60 or 75 °C copper (Cu) conductor and wire size range 12, 14 AWG, stranded or solid. The terminal tightening torque of 7.1 lb in (0.8 Nm).	
For FP series: the hub is to be connected to the conduit before the hub is connected to the enclosure.	

Please contact our technical department for the list of approved products.

Description

These switches are used on machines where the hazardous conditions remain for a while, even after the machine has been switched off, for example because of mechanical inertia of the pulleys, saw disks, mills. This switch has its ideal application where the guard is not opened frequently and the installation of a switch with solenoid would be too expensive.

These switches are considered interlocks with guard locking in accordance with ISO 14119, and the product is marked on the side with the symbol shown.

Head and knobs with variable orientation

The head can be quickly turned to each of the four sides of the switch by unfastening the two fastening screws.

The mechanical delay device can be rotated in 90° steps as well. This enables the switch to assume 32 different configurations.

Adjustment range

The actuation head of this switch features a wide range of travel. In this way the guard can oscillate along the direction of insertion (4.5 mm) without causing unwanted machine shutdowns. This wide range of travel is available in all actuators in order to ensure maximum device reliability.

Protection degree IP67

IP67 These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Contact blocks

Contact blocks with captive screws, finger protection, twin bridge contacts and double interruption for higher contact reliability. Available in multiple versions with shifted, simultaneous or overlapping actuation paths. They are suitable for many different applications.

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several guards are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked guards in their position with a retaining force of approx. 30 N, stopping any vibrations or gusts of wind from opening them.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Safety screws for actuators

As required by EN ISO 14119, the actuator must be fixed immovably to the guard frame. Pan head safety screws with one-way fitting are available for this purpose. With this screw type, the actuators cannot be removed or tampered by using common tools. See accessories on page 353.

Operation (FP 6R2-M2F1)

The switch is fastened to the machine body (A), while the stainless steel actuator is fastened to the guard (B). Once installed, the switch will firmly lock the actuator. In order to remove the actuator, the knob (C) has to be rotated. On the first turns the electrical contacts will positively open, then, after about 20 seconds (or 10 seconds depending on the version), the actuator will be released. In order to close the guard, the knob must be rotated in the opposite direction. This switch doesn't need power supply or timer and can be easily installed on old machines without important changes in their electrical circuit. The knob (C) may be supplied in a short (standard) or in a long version.

**Operating phases (FD 6R2-M2F1)**

Actuating force	10 N (18 N)	10 N (18 N)	10 N (18 N)

All values in the diagrams are in turns of the knob

Legend: With positive opening according to EN 60947-5-1, interlock with lock monitoring acc. to EN ISO 14119

How to read travel diagrams

All values in the diagrams are in turns of the knob

IMPORTANT:

The state of the NC contact refers to the switch with inserted actuator and with the knob turned anti-clockwise up to the end of the travel. For **installation in safety applications**, actuate the switch **at least up to the positive opening travel** shown in the travel diagrams with symbol . Actuate the switch **at least with the positive opening force**, reported in brackets below each article, next to the actuating force value.

Limits of use

Do not use where dust and dirt may penetrate in any way into the head and deposit there. Especially not where powder, shavings, concrete or chemicals are sprayed. Adhere to the EN ISO 14119 requirements regarding low coding level for interlocks. Do not use in environments with presence of explosive or flammable gas. In these cases, use ATEX products (see dedicated Pizzato catalogue).

Attention! These switches alone are not suitable for applications where operators may physically enter the dangerous area, because an eventual closing of the door behind them could restart the machine operation. In these cases, the maintenance personnel must use the actuator entry locking device VF KB1 shown on page 112.

Stainless steel actuators

IMPORTANT: These actuators can be used only with items of the FD, FP, FL, FC and FS series (e.g. FD 6R2-M2).

Low coding level acc. to EN ISO 14119.

The actuator can flex in four directions for applications where the guard alignment is not precise.

Actuator adjustable in two directions for guards with reduced dimensions.

Actuator adjustable in one direction for guards with reduced dimensions.

Universal actuator VF KEYF8

IMPORTANT: These actuators can be used only with items of the FD, FP, FL, FC and FS series (e.g. FD 6R2-M2).
Low coding level acc. to EN ISO 14119.

Article	Description
VF KEYF8	Universal actuator

Jointed actuator for guards with poor alignment, adjustable in two dimensions for small doors; can be mounted in various positions. The metal fixing body has two pairs of bore holes; it is provided for rotating the working plane of the actuator by 90°.

Accessories

Article	Description
VF KB1	Lock-out device

Padlockable lock-out device to prevent the actuator entry and the accidental closing of the door behind operators while they are in the danger area.
Hole diameter for padlocks: 9 mm.

Technical data

Housing

FP series housing made of glass fibre reinforced technopolymer, self-extinguishing, shock-proof and with double insulation:

FD series: metal housing, baked powder coating.

Metal head, baked epoxy powder coating.

One threaded conduit entry:

M20x1.5 (standard)

Protection degree:

IP67 acc. to EN 60529 with cable gland of equal or higher protection degree

General data

"Maximum SIL" up to:

SIL 3 acc. to EN IEC 62061

Performance Level (PL) up to:

PL e acc. to EN ISO 13849-1

Interlock with mechanical lock, coded:

type 2 acc. to EN ISO 14119

Coding level:

low acc. to EN ISO 14119

Safety parameters:

B_{100} :

1,000,000 for NC contacts

Mission time:

20 years

Ambient temperature:

-25°C ... +80°C (standard)

-40°C ... +80°C (T6 option)

Max. actuation frequency:

3600 operating cycles/hour

Mechanical endurance:

500,000 operating cycles

Max. actuation speed:

0.5 m/s

Min. actuation speed:

1 mm/s

Maximum force before breakage F_{TEST} :

1000 N acc. to EN ISO 14119

Max. holding force F_{ZH} :

770 N acc. to EN ISO 14119

Max. clearance of the actuator:

4.5 mm

Actuator extraction force:

30 N

Tightening torques for installation:

see page 381

Wire cross-sections and

wire stripping lengths:

see page 401

In compliance with standards:

IEC 60947-5-1, IEC 60947-1, IEC 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN IEC 63000, BG-GS-ET-15, UL 508, CSA C22.2 No. 14.

Approvals:

EN 60947-5-1, UL 508, CSA C22.2 No. 14, GB/T14048.5

Compliance with the requirements of:

Machinery Directive 2006/42/EC, EMC Directive 2014/30/EU, RoHS Directive 2011/65/EU.

Positive contact opening in conformity with standards:

IEC 60947-5-1, EN 60947-5-1.

⚠ If not expressly indicated in this chapter, for correct installation and utilization of all articles see chapter Utilization requirements from page 379 to page 394.

In compliance with standards:	EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU.

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings:	Q300 pilot duty (69 VA, 125-250 V dc) A600 pilot duty (720 VA, 120-600 V ac)
Environmental Ratings:	Types 1, 4X, 12, 13
Use	60 or 75 °C copper (Cu) conductor and wire size range 12, 14 AWG, stranded or solid. The terminal tightening torque of 7.1 lb in (0.8 Nm).
For FP series:	the hub is to be connected to the conduit before the hub is connected to the enclosure.

Please contact our technical department for the list of approved products.

Description

In these switches, equipped with a sturdy lock, the actuator can be removed from the head only after a complete 180° rotation of the key in the lock. The electrical contacts are switched as the key is turned; the actuator is released only after the NC contacts have been positively opened. Contacts activated by the lock are reset to the initial position only with inserted actuator and with the key in the locking position. It is impossible to rotate the key when the key locking device is unlocked and the actuator is removed (C state). These switches are considered interlocks with guard locking in accordance with ISO 14119, and the product is marked on the side with the symbol shown.

Head and release devices with variable orientation

The head can be quickly turned to each of the four sides of the switch by unfastening the two fastening screws.

The auxiliary key release device can be rotated in 90° steps as well. This enables the switch to assume 32 different configurations.

Adjustment range

The actuation head of this switch features a wide range of travel. In this way the guard can oscillate along the direction of insertion (4.5 mm) without causing unwanted machine shutdowns. This wide range of travel is available in all actuators in order to ensure maximum device reliability.

Protection degree IP67

IP67 These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Contact blocks

Contact blocks with captive screws, finger protection, twin bridge contacts and double interruption for higher contact reliability.

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several guards are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked guards in their position with a retaining force of approx. 30 N, stopping any vibrations or gusts of wind from opening them.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Safety screws for actuators

As required by ISO 14119, the actuator must be fixed immovably to the guard frame. Pan head safety screws with one-way fitting are available for this purpose. With this screw type, the actuators cannot be removed or tampered by using common tools. See accessories on page 353.

Operation

The switch is fastened to the machine body (A), while the stainless steel actuator is fastened to the guard (B). Once installed, the switch will firmly lock the actuator. To remove the actuator, the lock must be unlocked by turning the key (C). When the actuator is removed, the key cannot be put into the initial position anymore. The example shows how the contacts of the lock and actuator are switched and how the switch can be installed within the machine in such a way that only the release device is visible from the outside.

Operating phases

Contact positions related to switch states

Operating state	state A	state B	state C
Actuator	Inserted and locked	Inserted and released	Extracted
Lock	Closed	Open	Open

Contact block FD 1899 1NO+1NC controlled by the lock	
FD 2099 1NO+2NC controlled by the lock	
FD 2199 3NC controlled by the lock	
FD 2299 2NO+1NC controlled by the lock	
FD 2899 1NO+1NC controlled by the lock 1NC controlled by the actuator	
FD 2999 2NC controlled by the lock 1NC controlled by the actuator	
FD 3099 1NC controlled by the lock 2NC controlled by the actuator	

Limits of use

Do not use where dust and dirt may penetrate in any way into the head and deposit there. Especially not where powder, shavings, concrete or chemicals are sprayed. Adhere to the EN ISO 14119 requirements regarding low coding level for interlocks. Do not use in environments with presence of explosive or flammable gas. In these cases, use ATEX products (see dedicated Pizzato catalogue).

Attention! These switches alone are not suitable for applications where operators may physically enter the dangerous area, because an eventual closing of the door behind them could restart the machine operation. In these cases, the maintenance personnel must use the actuator entry locking device VF KB1 shown on page 120.

The key can be extracted from the lock with locked or released actuator.

Legend: With positive opening according to EN 60947-5-1, interlock with lock monitoring acc. to EN ISO 14119

All values in the diagrams are in mm or in degrees

→ The 2D and 3D files are available at www.pizzato.com

Stainless steel actuators

IMPORTANT: These actuators can be used only with items of the FD, FP, FL, FC, and FS series (e.g. FD 1899-M2).

Low coding level acc. to EN ISO 14119.

The actuator can flex in four directions for applications where the guard alignment is not precise.

Actuator adjustable in two directions for guards with reduced dimensions.

Actuator adjustable in one direction for guards with reduced dimensions.

Description

These switches are used on machines where the hazardous conditions remain for a while, even after the machines have been switched off, for example because of mechanical inertia of pulleys, saw disks, parts under pressure or with high temperatures. Thus, the switches can also be used if individual guards are only to be opened under certain conditions.

The versions with solenoid actuated NC contacts are considered interlocks with locking in accordance with ISO 14119, and the product's label is marked with the symbol shown.

Holding force of the locked actuator

The strong interlocking system guarantees a maximum actuator holding force of $F_{TEST} = 3000 \text{ N}$.

Wide-ranging actuator travel

The actuation head of this switch features a wide range of travel. In this way the guard can oscillate along the direction of insertion (4.5 mm) without causing unwanted machine shutdowns. This wide range of travel is available in all actuators in order to ensure maximum device reliability.

Heads and devices with variable orientation

The system can be variably configured by loosening the 4 screws on the head.

The key release device and the release button can also be rotated and secured independently of one another in steps of 90°. The device can thus assume 32 different configurations.

Contact blocks with 4 contacts

Innovative contact block with 4 contacts, available in various contact configurations for monitoring the actuator or the solenoid (patented). The unit is supplied with captive screws and self-lifting clamping plates. Removable finger protection for eyelet terminal. High-reliability electrical contacts with 4 contact points and double interruption.

Turnable key release with lock

The auxiliary key release device is used to allow the maintenance or the entry into the machinery to authorized personnel only. Turning the key corresponds to actuating the solenoid: the actuator is released. The device can be turned, thereby enabling installation of the safety switch in the machine while the release device remains accessible on the outside of the guard.

Safety screws for actuators

As required by EN ISO 14119, the actuator must be fixed immovably to the guard frame. Pan head safety screws with one-way fitting are available for this purpose. With this screw type, the actuators cannot be removed or tampered by using common tools. See accessories on page 353.

Key release device and escape release button

This device performs simultaneously the two functions mentioned above. The lock and button can be rotated in this case as well; the release button can be ordered with various lengths. The release button has priority over the lock, i.e., the emergency escape can be actuated to unlock the switch even if the lock is locked. To reset the switch, the lock and the button must be returned to their initial position.

Escape release button

This device is used to safeguard a hazardous area that an operator may enter with his entire body. The release button, which is oriented towards the inside of the danger zone, allows the operator to escape even in the event of a power failure. Pushing the button results in the same function as the auxiliary release device. To reset the switch, simply return the button to its initial position. The escape release button can be rotated and is available with different lengths. It is fixed to the switch by means of a screw allowing the installation of the switch both inside and outside the guards.

Key release with triangular key

The auxiliary key release is also available with option V73, a variant with triangular key acc. to DIN 22417. This option can be used with installations in which the auxiliary release is to be actuated with a triangular key that is not normally available. On request, option V70 is also available, with which the auxiliary release returns to the initial position with the aid of a spring.

Non-detachable heads and release devices

The head and the release device can be rotated but cannot be detached from each other. This makes the switch more secure since the problem of incorrect assembly by the installer cannot occur; in addition, the risk of damage is lower (loss of small parts, penetration of dirt, etc.).

LED display unit, type A

In the version with LED display unit of type A, two green LEDs are switched-on directly by the power supply of the solenoid. Wiring is not necessary.

LED display unit, types B and C

In the version with LED display unit of type B, connection wires from two LEDs are available, one green and one red. By means of suitable connections on the contact block, various operating states of the switch can be displayed externally.

Protection degree IP67

IP67 These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Extended temperature range

-40°C These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +60°C.

They can therefore be used for applications in cold stores, sterilisers, and other equipment operated in very low-temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Three conduit entries

The switch is provided with three conduit entries in different directions. This allows its application in series connections or in narrow places.

Laser engraving

All FG series switches are permanently marked with a special laser system. As a result, the marking remains legible even under extreme operating conditions. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Sealable auxiliary release device

Switches with locked actuator with deactivated solenoid (function principle D) are equipped with an auxiliary release device for the solenoid to simplify installation of the switch and to facilitate entry into the danger zone in the event of a power failure. The auxiliary release device acts on the switch exactly as if the solenoid was energised. As a result, it also actuates the electrical contacts. Can only be actuated with the use of two tools; this ensures adequate protection against tampering. If necessary, it can be sealed using the appropriate hole.

Access monitoring

These safety switches alone do not provide sufficient personal protection to the operators or maintenance personnel in situations where they completely enter the danger zone, since unintentional closing of a door after entry could cause the machine to re-start. If the re-start release is completely dependent on these switches, a system for preventing this danger must be provided, e.g. the padlockable device for actuator entry locking VF KB2 (page 135) or a safety handle, such as P-KUBE 1 (page 225), P-KUBE Fast (page 237) or P-KUBE Lite (page 241).

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several guards are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked guards in their position with a retaining force of approx. 30 N, stopping any vibrations or gusts of wind from opening them.

LED signalling lights

Thanks to the three threaded cable entries, the high luminosity LED signalling lights of the VF SL series can be installed on the switch.

The LED signalling lights can be easily installed by screwing them on one of the conduit entries not used for electric cables. They can be used for many different purposes: for example, to signal, from a distance, whether the switch has been actuated; whether the guard has closed correctly; or whether the guard is locked or unlocked.

For more information see chapter Accessories, page 353.

Main features

- Actuator holding force F_{TEST} : 3000 N
- 30 contact blocks with 4 contacts
- Metal housing, three M20 conduit entries
- Protection degree IP67
- Versions with key release and escape release button
- 4 stainless steel actuators
- Head and release devices, individually turnable and non-detachable
- Signalling LEDs
- Operation with energised or de-energised solenoid

 Utilization category: AC15
 Operating voltage (U_o): 400 Vac (50 Hz)
 Operating current (I_o): 3 A

Forms of the contact element: X+X+X+X, Y+Y+Y+Y, X+Y+Y+Y, X+X+Y+Y, X+X+X+Y
 Positive opening of contacts on all contact blocks: 60A, 60B, 60C, 60D, 60E, 60F, 60G, 60H, 60I, 60L, 60M, 60N, 60P, 60R, 60S, 60T, 60U, 60V, 60X, 60Y, 61A, 61B, 61C, 61D, 61E, 61G, 61H, 61M, 61R, 61S

In compliance with standards: EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU.

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings: A300 pilot duty (720 VA, 120-300 Vac)
 Q300 pilot duty (69 VA, 125-250 Vdc)
 Environmental Ratings: Types 1, 4X, 12, 13

Please contact our technical department for the list of approved products.

Operating principle

The operating principle of these safety switches allows three different operating states:

- state A**: with inserted and locked actuator
- state B**: with inserted but not locked actuator
- state C**: with extracted actuator

All or some of these states can be monitored by means of electrical NO contacts or NC contacts with positive opening by selecting the appropriate contact blocks. In detail, contact blocks that have electric contacts marked with the symbol of the solenoid () are switched in the transition between the state A and state B, while the electric contacts marked with the symbol of the actuator () are switched between state B and state C.

Operating principle

Select from two operating principles for actuator locking:

- **Operating principle D**: locked actuator with de-energised solenoid. The actuator is released by energising the solenoid (see example of the operating phases).
- **Operating principle E**: locked actuator with energised solenoid. The actuator is released by switching off the power supply to the solenoid. This version should only be used under certain conditions, since a power failure at the system will result in the immediate opening of the guard.

Example: operating phases with FG 60AD1D0A-F21 (switch with operating principle D)

Universal actuator VF KEYF28

IMPORTANT: These actuators can be used only with items of the FG and FY series (e.g. FG 60AD1D0A-F28).
Low coding level acc. to EN ISO 14119.

	Article	Description
	VF KEYF28	Universal actuator

Jointed actuator for guards with poor alignment, adjustable in two dimensions for small doors; can be mounted in various positions. The metal fixing body has two pairs of bore holes; it is provided for rotating the working plane of the actuator by 90°.

Auxiliary key release with triangular key

Articles with the V70 and V73 option have an auxiliary key release with a triangular key that meets DIN 22417 standards.

This type of lock can be used in situations where the switch must only be unlocked using the corresponding triangular key, a tool which is not usually available.

There are two versions of the triangular key release: with a spring return (option V70) and without a spring return (option V73).

Release button

Article	Description
VF FG-LP15	Technopolymer release button for max. 15 mm wall thickness, supplied with screw
VF FG-LP30	Technopolymer release button for max. 30 mm wall thickness, supplied with screw
VF FG-LP40	Technopolymer release button for max. 40 mm wall thickness, supplied with screw
VF FG-LP60	Metal release button for max. 60 mm wall thickness, supplied with screw

M10 threaded bar

Article	Description
VF FG-LPRG	Metal release button for wall thickness from 60 to 500 mm, supplied with 2 supports and 2 screws, without M10 threaded bar

The M10 bar can be supplied in zinc-plated steel with 1 m length. Article: AC 8512.

Other release button lengths

-LP30

For wall thickness
15 ... 30 mm

-LP40

For wall thickness
30 ... 40 mm

-LP60

For wall thickness
40 ... 60 mm

-LPRG

For wall thickness
60 ... 500 mm

-LP30, -LP40, -LP60:

- Avoid bending and twisting the release button.
- To guarantee correct device operation, keep a distance of 10 ... 25 mm between the wall and the release button.
- The actuation path of the release button must always be kept clean. Dirt or chemical products could compromise the device operation.
- Periodically check the device for proper function.

-LPRG:

- Avoid bending and twisting the release button.
- On the inside of the wall, use a bushing or a tube with an inner diameter of 18 ± 0.5 mm as a guide.
- Guide in the M10 threaded rod in such a way so as to prevent bending. The M10 threaded rod is not supplied with the device.
- Use medium-strength thread locker to secure the threaded rod.
- Do not exceed an overall length of 500 mm between the release button and the switch.
- To guarantee correct device operation, keep a distance of 10 ... 25 mm between the wall and the release button.
- The actuation path of the release button must always be kept clean. Dirt or chemical products could compromise the device operation.
- Periodically check the device for proper function.

Accessories

Article	Description
VF KB2	Lock-out device

Padlockable lock-out device to prevent the actuator entry and the accidental closing of the door behind operators while they are in the danger area.
To be used only with FG and FY series switches (e.g. FG 60AD1D0A). Hole diameter for padlocks: 9 mm.

Article	Description
VF KLA371	Set of two locking keys

Extra copy of the locking keys to be purchased if further keys are needed (standard supply: 2 units).
The keys of all switches have the same code. Other codes on request.

All values in the drawings are in mm

Accessories See page 353

→ The 2D and 3D files are available at www.pizzato.com

Safety modules

Pizzato Elettrica offers its customers a wide range of safety modules. These were developed taking into consideration typical problems encountered during the monitoring of safety switches under actual operating conditions. Safety modules with instantaneous or delayed contacts for emergency circuits of type 0 (immediate stop) or type 1 (controlled stop).

Safety switches with solenoid of the FG series can be connected to safety modules for the realization of safety circuits up to PL e acc. to EN ISO 13849. For technical information or wiring diagrams, please contact our technical office.

Application example with safety timer

Application example with safety module for standstill monitoring

Note: The NC contacts of K1 and K2 are mechanically guided (EN 60947-4-1, Annex F)

Description

These switches are used on machines where the hazardous conditions remain for a while, even after the machines have been switched off, for example because of mechanical inertia of pulleys, saw disks, parts under pressure or with high temperatures. Thus, the switches can also be used if individual guards are only to be opened under certain conditions.

The versions with solenoid actuated NC contacts are considered interlocks with locking in accordance with ISO 14119, and the product's label is marked with the symbol shown.

Technopolymer housing

The FY series safety switches have glass fibre reinforced housing made of reinforced technopolymer that is shock-proof, self-extinguishing and very resistant to the extraction force that can be exerted by the actuator.

The new design combines robustness and functionality with a modern aesthetic.

Holding force of the locked actuator

The strong interlocking system guarantees a maximum actuator holding force of $F_{TEST} = 2800 \text{ N}$.

Integrated control devices

The switch is also available with integrated control devices, allowing up to two devices and related contact blocks, such as buttons, emergency stop buttons, indicator lights or selectors to be mounted.

The result is a compact solution with direct access to control devices without needing to install them separately on the switch panel or in their own housing.

The devices can be illuminated and, thanks to the PUSH-IN spring-operated connections, wiring is quick and intuitive.

Heads and devices with variable orientation

The system can be variably configured by loosening the 4 screws on the head.

The key release device and the release button can also be rotated and secured independently of one another in steps of 90° . The device can thus assume 32 different configurations.

Key release with triangular key

The auxiliary key release is also available with option V73, a variant with triangular key acc. to DIN 22417. This option can be used with installations in which the auxiliary release is to be actuated with a triangular key that is not normally available.

On request, option V70 is also available, with which the auxiliary release returns to the initial position with the aid of a spring.

Non-detachable heads and release devices

The head and the release device can be rotated but cannot be detached from each other. This makes the switch more secure since the problem of incorrect assembly by the installer cannot occur; in addition, the risk of damage is lower (loss of small parts, penetration of dirt, etc.).

Wide-ranging actuator travel

The actuation head of this switch features a wide range of travel. In this way the guard can oscillate along the direction of insertion (4.5 mm) without causing unwanted machine shutdowns. This wide range of travel is available in all actuators in order to ensure maximum device reliability.

Key release device and escape release button

The key release device (auxiliary release) is used to permit unlocking of the actuator only by personnel in possession of the key. The device also functions with no power supply and, once actuated, prevents the guard from being locked.

The escape release button allows actuator release and immediate opening of the guard. Generally used in machines within which an operator could inadvertently become trapped, it faces towards the machine interior, to allow the operator to exit even in the event of

power failure. The button has two stable states and can be freely extended in length with suitable extensions (see accessories).

Both devices can be positioned on the four sides of the switch. As a result, it can be installed both towards the interior and towards the exterior of the machine.

Contact blocks with 4 contacts

Innovative contact block with 4 contacts, available in various contact configurations for monitoring the actuator or the solenoid (patented). The unit is supplied with captive screws and self-lifting clamping plates. Removable finger protection for eyelet terminal.

High-reliability electrical contacts with 4 contact points and double interruption.

Safety screws for actuators

As required by EN ISO 14119, the actuator must be fixed immovably to the guard frame. Pan head safety screws with one-way fitting are available for this purpose. With this screw type, the actuators cannot be removed or tampered by using common tools. See accessories on page 353.

LED display unit, type A

In the version with LED display unit of type A, two green LEDs are switched-on directly by the power supply of the solenoid. Wiring is not necessary.

Protection degree IP67

IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Three conduit entries

The switch is provided with three conduit entries in different directions. This allows its application in series connections or in narrow places.

Sealable auxiliary release device

Switches with locked actuator with deactivated solenoid (function principle D) are equipped with an auxiliary release device for the solenoid to simplify installation of the switch and to facilitate entry into the danger zone in the event of a power failure.

The auxiliary release device acts on the switch exactly as if the solenoid was energised. As a result, it also actuates the electrical contacts. Can only be actuated with the use of two tools; this ensures adequate protection against tampering. If necessary, it can be sealed using the appropriate hole.

LED display unit, types B and C

In the version with LED display unit of type B, connection wires from two LEDs are available, one green and one red. By means of suitable connections on the contact block, various operating states of the switch can be displayed externally.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +60°C.

They can therefore be used for applications in cold stores, sterilisers, and other equipment operated in very low-temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Laser engraving

All FY series switches are permanently marked with a special laser system. As a result, the marking remains legible even under extreme operating conditions. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

In the versions with buttons on the cover, the button lenses can be laser-engraved on request so that the desired texts are directly and permanently applied to the lenses.

Access monitoring

P-KUBE 1

P-KUBE Fast

P-KUBE Lite

These safety switches alone do not provide sufficient personal protection to the operators or maintenance personnel in situations where they completely enter the danger zone, since unintentional closing of a door after entry could cause the machine to re-start. If the re-start release is completely dependent on these switches, a system for preventing this danger must be provided, e.g. the padlockable device for actuator entry locking VF KB2 (page 154) or a safety handle, such as P-KUBE 1 (page 225), P-KUBE Fast (page 237) or P-KUBE Lite (page 241).

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several guards are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked guards in their position with a retaining force of approx. 30 N, stopping any vibrations or gusts of wind from opening them.

LED signalling lights

Thanks to the three threaded cable entries, the high luminosity LED signalling lights of the VF SL series can be installed on the switch.

The LED signalling lights can be easily installed by screwing them on one of the conduit entries not used for electric cables. They can be used for many different purposes: for example, to signal, from a distance, whether the switch has been actuated; whether the guard has closed correctly; or whether the guard is locked or unlocked.

For more information see chapter Accessories, page 353.

Operating principle	
D1D	locked actuator with de-energised solenoid. With sealable auxiliary release device.
D1E	locked actuator with energised solenoid
D5D	locked actuator with de-energised solenoid. With auxiliary key release.
D6D	locked actuator with de-energised solenoid. With auxiliary key release and escape release button.
D7D	locked actuator with de-energised solenoid. With sealable auxiliary release device and escape release button.
D7E	locked actuator with energised solenoid. With escape release button.

Auxiliary release options

(for articles FY ...D5D..., FY ...D6D... only)

	The key can be removed in locked and unlocked actuator position (standard)
V34	The key can be removed only in the locked position of the actuator
V70	Key release with triangular key with spring return (description on page 151)
V73	Key release with triangular key, no spring return (description on page 151)

Ambient temperature

	-25°C ... +60°C (standard)
T6	-40°C ... +60°C

Pre-installed connectors

	without connector (standard)
K110	M12 metal connector, 12-pole, bottom
K800	M23 metal connector, 12-pole, bottom
K820	M23 metal connector, 19-pole, bottom, configuration 1
...	...

For the complete list of possible combinations please contact our technical department.
Note: The 19-pole M23 connector is only available for versions with integrated control devices and 24 Vdc supply voltage.

Contact type

	silver contacts (standard)
G	silver contacts with 1 µm gold coating

Actuators

	without actuator (standard)
F20	straight actuator VF KEYF20
F21	angled actuator VF KEYF21
F22	actuator with rubber pads VF KEYF22
F28	universal actuator VF KEYF28

Button configurations

N02	configuration 02
N03	configuration 03
...	other configurations on request

Release button length

	for max. 15 mm wall thickness (standard)
LP30	for max. 30 mm wall thickness
LP40	for max. 40 mm wall thickness
LP60	for max. 60 mm wall thickness
LPRG	adjustable, for wall thickness from 60 mm to 500 mm

Signalling LEDs

A	two green LEDs switched-on by the solenoid power supply
B	red and green LEDs, freely configurable
C	orange and green LEDs, freely configurable
Z	without LED

Solenoid supply voltage

0	24 Vac/dc (-10% ... +10%)
1	120 Vac/dc (-15% ... +10%)
2	230 Vac (-15% ... +10%)
3	12 Vdc (-10% ... +10%)

Main features

- Actuator holding force F_{TEST} : 2800 N
- 30 contact blocks with 4 contacts
- Technopolymer housing, three M20 conduit entries
- Protection degrees IP67 and IP69K
- Versions with key release and escape release button
- Versions with integrated control devices
- 4 stainless steel actuators
- Head and release devices, individually turnable and non-detachable
- Signalling LEDs
- Operation with energised or de-energised solenoid

Quality marks:

IMQ approval: CA02.03808
 UL approval: E131787
 CCC approval: 2024010305656751

Technical data

Housing

Housing made of glass fibre reinforced technopolymer, self-extinguishing and shock-proof
 Head and release device both made of metal, powder-coated and fired in a kiln
 Three knock-out threaded conduit entries: M20x1.5 (standard)
 Protection degree: IP67 acc. to EN 60529 (with cable gland of equal or higher protection degree)
 IP69K acc. to ISO 20653 (Protect the cables from direct high-pressure and high-temperature jets)
 Protection degree with control devices: IP65 acc. to EN 60529

General data

"Maximum SIL" up to: SIL 3 acc. to EN IEC 62061
 Performance Level (PL) up to: PL e acc. to EN ISO 13849-1
 Interlock with mechanical lock, coded: type 2 acc. to EN ISO 14119
 Coding level: low acc. to EN ISO 14119
 Safety parameters:
 B_{10D} : 5,000,000 for NC contacts
 Mission time: 20 years
 Ambient temperature: -25°C ... +60°C (standard)
 -40°C ... +60°C (T6 option)
 Max. actuation frequency: 600 operating cycles/hour
 Mechanical endurance: 1 million operating cycles
 Max. actuation speed: 0.5 m/s
 Min. actuation speed: 1 mm/s
 Maximum force before breakage F_{TEST} : 2800 N acc. to EN ISO 14119
 Max. holding force F_{ZH} : 2150 N acc. to EN ISO 14119
 Maximum clearance of locked actuator: 4.5 mm
 Released actuator extraction force: 30 N
 Tightening torques for installation: see page 381
 Wire cross-sections and wire stripping lengths: see page 144

Solenoid

Duty cycle: 100% ED (continuous operation)
 Solenoid consumption: 9 VA

In compliance with standards:

EN 60947-5-1, EN 60947-1, EN 60204-1, EN ISO 14119, EN ISO 12100, EN 60529, EN 61000-6-2, EN 61000-6-3, EN IEC 63000, BG-GS-ET-15, BG-GS-ET-19, UL 508, CSA C22.2 No. 14.

Approvals:

EN 60947-5-1, UL 508, CSA C22.2 No. 14, GB/T14048.5

Compliance with the requirements of:

Machinery Directive 2006/42/EC, EMC Directive 2014/30/EU, RoHS Directive 2011/65/EU.

Positive contact opening in conformity with standards:

IEC 60947-5-1, EN 60947-5-1.

⚠ If not expressly indicated in this chapter, for correct installation and utilization of all articles see chapter Utilization requirements from page 379 to page 394.

Features approved by IMO

Rated insulation voltage (U_i): 400 Vac
Conventional free air thermal current (I_{th}): 6 A
Rated impulse withstand voltage (U_{imp}): 6 kV
Protection degree of the housing: IP67/IP69K (without auxiliary buttons)
IP65 (with auxiliary buttons)

MV terminals (screw terminals)

Utilization category: AC15
Operating voltage (U_o): 400 Vac (50 Hz)
Operating current (I_o): 3 A

Forms of the contact element: X+Y+X+Y, Y+Y+X+Y, Y+Y+Y+Y, X+Y+Y+Y, X+Y+Y+X, Y+Y+Y+X, X+X+Y+Y, X+X+Y+X, X+Y+X+X, Y+Y+X+X, X+X+X+X, Y+X+X+X, X+X+X+Y.

Positive opening of contacts with the following contact blocks: 60A, 60B, 60C, 60D, 60E, 60F, 60G, 60H, 60I, 60L, 60M, 60N, 60P, 60R, 60S, 60T, 60U, 60V, 60X, 60Y, 61A, 61B, 61C, 61D, 61E, 61G, 61H, 61M, 61R, 61S.

In compliance with standards: EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU.

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings:

Main ratings:

Input with coil 12 Vdc, 24 Vac/dc, 120 Vac/dc, 230Vac

Output Pilot Duty B300, Q300

Overvoltage category II

Secondary ratings:

Output 24 Vac/dc "Class 2" 0.25 A Pilot Duty (Maximum two Actuators, with maximum five contacts, NO or NC or both)

Environmental Ratings:

Enclosure type 1, 4X, 12, 13 for model FY 6xxxxxx-xxx

Enclosure type 1 for model FY 6xxxxxx-Nxx

The hub is to be connected to the conduit before the hub is connected to the enclosure.

Value of tightening torque of cover's screws 1.0-1.2 Nm.

Operating principle

The operating principle of these safety switches allows three different operating states:

state A: with inserted and locked actuator

state B: with inserted but not locked actuator

state C: with extracted actuator

All or some of these states can be monitored by means of electrical NO contacts or NC contacts with positive opening by selecting the appropriate contact blocks. In detail, contact blocks that have electric contacts marked with the symbol of the solenoid () are switched in the transition between the state A and state B, while the electric contacts marked with the symbol of the actuator () are switched between state B and state C.

Operating principle

Select from two operating principles for actuator locking:

- **Operating principle D**: locked actuator with de-energised solenoid. The actuator is released by energising the solenoid (see example of the operating phases).
- **Operating principle E**: locked actuator with energised solenoid. The actuator is released by switching off the power supply to the solenoid. This version should only be used under certain conditions, since a power failure at the system will result in the immediate opening of the guard.

Example: operating phases with FY 60AD1D0A-F21 (switch with operating principle D)

Contact positions related to switch states

Operating state	Operating principle D locked actuator with de-energised solenoid			Operating principle E locked actuator with energised solenoid		
	state A	state B	state C	state A	state B	state C
Actuator	Inserted and locked	Inserted and released	Extracted	Inserted and locked	Inserted and released	Extracted
Solenoid	De-energised	Energised	-	Energised	De-energised	-
FY 60A 1NO+1NC controlled by the solenoid 1NO+1NC controlled by the actuator

Universal actuator VF KEYF28

IMPORTANT: These actuators can be used only with items of the FG and FY series (e.g. FY 60AD1D0A-F28).
Low coding level acc. to EN ISO 14119.

	Article	Description
	VF KEYF28	Universal actuator

Jointed actuator for guards with poor alignment, adjustable in two dimensions for small doors; can be mounted in various positions.
The metal fixing body has two pairs of bore holes; it is provided for rotating the working plane of the actuator by 90°.

Auxiliary key release with triangular key

Articles with the V70 and V73 option have an auxiliary key release with a triangular key that meets DIN 22417 standards.

This type of lock can be used in situations where the switch must only be unlocked using the corresponding triangular key, a tool which is not usually available.

There are two versions of the triangular key release: with a spring return (option V70) and without a spring return (option V73).

⁽¹⁾ The contacts in brackets are on request. Contact our technical department to verify the effective feasibility of the control device unit with the chosen combination of control devices.

⁽²⁾ The NO contact with spring-return is only activated if the emergency stop button reaches the limit of travel. The signal of the NO contact is captured by analysing the rising edge.

To order buttons with marking:

add the marking code indicated in the chapter Accessories on page 375 to the article codes.

Example: Black spring-return button with "O" engraving.

VN NG-AC27122 → VN NG-AC27122-L1

Technical data of the control devices

General data

Protection degree:	IP65 acc. to EN 60529
Mechanical endurance:	
Spring-return button:	1 million operating cycles
Emergency stop button:	50,000 operating cycles
Selector switch:	300,000 operating cycles
Key selector switch:	50,000 operating cycles
	30,000 operating cycles including removal of the key
Safety parameter B_{10D} :	130,000 (emergency stop button)

Actuating force

Spring-return button:	min. 4 N	max. 100 N
Emergency stop button:	min. 20 N	max. 100 N
Selector switch:	min. 0.1 Nm	max. 1.5 Nm
Key selector switch:	min. 0.1 Nm	max. 1.3 Nm

Contact blocks of the control devices

Material of the contacts:	silver contacts
Contact type:	Self-cleaning contacts with double interruption

Electrical data:

Thermal current I_{th} :	1 A
Rated insulation voltage U_i :	32 Vac/dc
Rated impulse withstand voltage U_{imp} :	1.5 kV
LED supply voltage:	24 Vdc $\pm$ 15%
LED supply current:	10 mA per LED

Utilization category of the contact block:

Direct current: DC13
U_e (V) 24
I_e (A) 0,55

Signalling contact with spring return:

Direct current: DC13
U_e (V) 24
I_e (mA) 10

In compliance with standards:

IEC 60947-5-1, IEC 60947-5-5, EN ISO 13850

⚠ Installation for safety applications:

Always connect the safety circuit to the **NC contacts** (normally closed contacts) as stated in standard EN 60947-5-1.

Accessories

Article	Description
VF KB2	Lock-out device

Padlockable lock-out device to prevent the actuator entry and the accidental closing of the door behind operators while they are in the danger area.

To be used only with FG and FY series switches (e.g. FY 60AD1D0A). Hole diameter for padlocks: 9 mm.

Article	Description
VF KLA371	Set of two locking keys

Extra copy of the locking keys to be purchased if further keys are needed (standard supply: 2 units).

The keys of all switches have the same code. Other codes on request.

Release button

Article	Description
VF FG-LP15	Technopolymer release button for max. 15 mm wall thickness, supplied with screw
VF FG-LP30	Technopolymer release button for max. 30 mm wall thickness, supplied with screw
VF FG-LP40	Technopolymer release button for max. 40 mm wall thickness, supplied with screw
VF FG-LP60	Metal release button for max. 60 mm wall thickness, supplied with screw

Article	Description
VF FG-LPRG	Metal release button for wall thickness from 60 to 500 mm, supplied with 2 supports and 2 screws, without M10 threaded bar

The M10 bar can be supplied in zinc-plated steel with 1 m length. Article: AC 8512.

Note: For other release-button lengths see the indications on page 135.

Description

These switches are used on machines where the hazardous conditions remain for a while, even after the machines have been switched off, for example because of mechanical inertia of pulleys, saw disks, parts under pressure or with high temperatures. Thus, the switches can also be used if individual guards are only to be opened under certain conditions.

The versions with solenoid actuated NC contacts are considered interlocks with locking in accordance with ISO 14119, and the product's label is marked with the symbol shown.

Head and release devices with variable orientation

The head can be quickly turned to each of the four sides of the switch by unfastening the two fastening screws.

The auxiliary key release device can be rotated in 90° steps as well. This enables the switch to assume 32 different configurations.

Wide-ranging actuator travel

The actuation head of this switch features a wide range of travel. In this way the guard can oscillate along the direction of insertion (4.5 mm) without causing unwanted machine shutdowns. This wide range of travel is available in all actuators in order to ensure maximum device reliability.

Holding force of the locked actuator

The robust interlocking system guarantees a maximum actuator holding force of $F_{TEST} = 1100 \text{ N}$.

Safety screws for actuators

As required by EN ISO 14119, the actuator must be fixed immovably to the guard frame. Pan head safety screws with one-way fitting are available for this purpose. With this screw type, the actuators cannot be removed or tampered by using common tools. See accessories on page 353.

Protection degree IP67

IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Turnable key release with lock

The auxiliary key release device is used to allow the maintenance or the entry into the machinery to authorized personnel only. Turning the key corresponds to actuating the solenoid: the actuator is released. The device can be turned, thereby enabling installation of the safety switch in the machine while the release device remains accessible on the outside of the guard.

Contact blocks

Contact blocks with captive screws, finger protection, twin bridge contacts and double interruption for higher contact reliability. Versions with gold-plated contacts available. Available in multiple variants with actuation by actuator or by solenoid.

Circuit board for monitoring the current consumption of the solenoid

This technical solution resolves the problems that may derive from unstable power supply (machine distance from main transformers, voltage variation between night/day hours), allowing also a low solenoid power consumption and consequently enlarging the working temperature range of the switch.

Key release with triangular key

The auxiliary key release is also available with option V73, a variant with triangular key acc. to DIN 22417. This option can be used with installations in which the auxiliary release is to be actuated with a triangular key that is not normally available.

On request, option V70 is also available, with which the auxiliary release returns to the initial position with the aid of a spring.

Laser engraving

All FS series switches are permanently marked with a special laser system. As a result, the marking remains legible even under extreme operating conditions. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several guards are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked guards in their position with a retaining force of approx. 30 N, stopping any vibrations or gusts of wind from opening them.

Two operating principles

D or E

The safety switches with solenoid offer two different operating principles for the actuator locking:

Operating principle D: locked actuator with de-energised solenoid. The actuator is released by energising the solenoid.

Operating principle E: locked actuator with energised solenoid. The actuator is released by switching off the power supply to the solenoid. This version should only be used under certain conditions, since a power failure at the system will result in the immediate opening of the guard.

Sealable auxiliary release device

Switches with locked actuator with deactivated solenoid (function principle D) are equipped with an auxiliary release device for the solenoid to simplify installation of the switch and to facilitate entry into the danger zone in the event of a power failure. The

auxiliary release device acts on the switch exactly as if the solenoid was energised. As a result, it also actuates the electrical contacts. Can only be actuated with a couple of tools, this ensures adequate resistance to tampering. If required it can be sealed by means of the hole provided.

Cable outlets

The switch is provided with three cable entries in different directions. This allows its application in series connections or in narrow places.

Gold-plated contacts

The contact blocks of these devices can be supplied gold-plated upon request. Ideal for applications with low voltages or currents; it ensures increased contact reliability. Available in two thicknesses (1 or 2.5 microns), it adapts perfectly to the various fields of application, ensuring a long endurance over time.

LED signalling lights

Thanks to the three threaded cable entries, the high luminosity LED signalling lights of the VF SL series can be installed on the switch.

The LED signalling lights can be easily installed by screwing them on one of the conduit entries not used for electric cables. They can be used for many different purposes: for example, to signal, from a distance, whether the switch has been actuated; whether the guard has closed correctly; or whether the guard is locked or unlocked.

For more information see chapter Accessories, page 353.

Operating principle

The operating principle of these safety switches allows three different operating states:

state A: with inserted and locked actuator

state B: with inserted but not locked actuator

state C: with extracted actuator

All or some of these states can be monitored by means of electrical contacts with positive opening by selecting the appropriate contact blocks. In detail, contact blocks that have electric contacts marked with the symbol of the solenoid () are switched in the transition between the state A and state B, while the electric contacts marked with the symbol of the actuator () are switched between state B and state C.

It is also possible to choose between two operating principles for the actuator locking:

- Operating principle D: locked actuator with de-energised solenoid. The actuator is released by energising the solenoid (see example of the operating phases).
- Operating principle E: locked actuator with energised solenoid. The actuator is released by switching off the power supply to the solenoid. This version should only be used under certain conditions, since a power failure at the system will result in the immediate opening of the guard.

Example: operating phases with FS 2896D024-F1 (switch with operating principle D)

Installation of two or more switches connected to the same power supply

24 V AC/DC versions only

- This operation is intended to reduce the effects of the combined solenoid inrush currents on the power supply and should only be executed if necessary and with great care.
- Switch off the power supply.
- Open the switch cover.
- Loosen the two screws that secure the black plastic protective cover of the solenoid to the switch body and remove the plastic protective cover.
- Use a pin to set the selector switch so that each switch has a different combination (see figure at the side). If more than two switches are installed, repeat the combinations for any next set of two switches.
- Reposition the black plastic protective cover and tighten the two screws with a torque of 0.8 Nm.

Limits of use

Do not use where dust and dirt may penetrate in any way into the head and deposit there. Especially not where powder, shavings, concrete or chemicals are sprayed. Adhere to the EN ISO 14119 requirements regarding low coding level for interlocks. Do not use in environments with presence of explosive or flammable gas. In these cases, use ATEX products (see dedicated Pizzato catalogue).

Attention! These switches alone are not suitable for applications where operators may physically enter the dangerous area, because an eventual closing of the door behind them could restart the machine operation. In these cases, the maintenance personnel must use the actuator entry locking device VF KB1 shown on page 165.

Auxiliary key release with triangular key

Articles with the V70 and V73 option have an auxiliary key release with a triangular key that meets DIN 22417 standards.

This type of lock can be used in situations where the switch must only be unlocked using the corresponding triangular key, a tool which is not usually available.

There are two versions of the triangular key release: with a spring return (option V70) and without a spring return (option V73).

Accessories

Article	Description
VF KB1	Lock-out device

Padlockable lock-out device to prevent the actuator entry and the accidental closing of the door behind operators while they are in the danger area.
Hole diameter for padlocks: 9 mm.

Article	Description
VF KLA371	Set of two locking keys

Extra copy of the locking keys to be purchased if further keys are needed (standard supply: 2 units).
The keys of all switches have the same code. Other codes on request.

Stainless steel actuators

IMPORTANT: These actuators can be used only with items of the FD, FP, FL, FC, and FS series (e.g. FS 1896D024-M2).
Low coding level acc. to EN ISO 14119.

	Article	Description
	VF KEYF	Straight actuator

	Article	Description
	VF KEYF1	Angled actuator

	Article	Description
	VF KEYF2	Jointed actuator

The actuator can flex in four directions for applications where the guard alignment is not precise.

	Article	Description
	VF KEYF3	Actuator adjustable in two directions

Actuator adjustable in two directions for guards with reduced dimensions.

	Article	Description
	VF KEYF7	Actuator adjustable in one direction

Actuator adjustable in one direction for guards with reduced dimensions.

	Article	Description
	VF KEYF8	Universal actuator

Jointed actuator for guards with poor alignment, adjustable in two dimensions for small doors; can be mounted in various positions. The metal fixing body has two pairs of bore holes; it is provided for rotating the working plane of the actuator by 90°.

[illegible]This image shows a full page of blank graph paper. The grid consists of small, equal-sized squares formed by thin, dark gray lines. There are 20 columns and 20 rows of squares, creating a total of 400 square units. The background is white, and the grid covers the entire area of the page.

Description

These switches are used on machines where the hazardous conditions remain for a while, even after the machines have been switched off, for example because of mechanical inertia of pulleys, saw disks, parts under pressure or with high temperatures. Thus, the switches can also be used if individual guards are only to be opened under certain conditions. Versions with mode 1 and 3 (safety outputs active when guard closed and locked) are interlocks with guard locking acc. to ISO 14119; the product is labelled with the symbol shown.

Maximum safety with a single device

PL e + SIL 3

The NG series switches are constructed with redundant electronics. As a result, the maximum PL e and SIL 3 safety levels can still be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a module suitable for managing devices with semiconductor outputs, or to a safety PLC.

Series connection of several switches

One of the most important features of the NG series is the possibility of connecting up to 32 sensors in series, while still maintaining the maximum safety levels PL e laid down in EN ISO 13849-1 and SIL 3 acc. to EN IEC 62061:2021.

This connection type is permissible in safety systems which have a safety module at the end of the chain that monitors the outputs of the last NG switch.

The fact that the PL e safety level can be maintained even with 32 sensors connected in series demonstrates the extremely secure structure of each single device.

Series connection with other devices

The NG series features two safety inputs and two safety outputs, which can be connected in series with other Pizzato Elettrica safety devices. This option allows the creation of safety chains containing various devices. For example, stainless steel safety hinges (HX BEE1 series), transponder sensors (ST series) and door lock sensors (NG series) can be connected in series while still maintaining the maximum PL e and SIL 3 safety levels.

RFID actuators with high coding level

The NG series is provided with an electronic system based on RFID technology to detect the actuator. This allows to provide each actuator with different coding and makes it impossible to tamper with a device by using another actuator of the same series. Millions of different coding combinations are possible for the actuators. They are therefore classified as high level coded actuators, according to EN ISO 14119.

actuators, according to EN ISO 14119.

Push-in spring-operated connections

The switch is provided with a PUSH-IN type spring-operated connection system on the inside. This technology allows wiring to be performed quickly and easily, as the wire just needs to be inserted into the appropriate hole in order to establish the electrical connection and automatically secure the wire. This operation can be performed with rigid or flexible wires with a crimped wire-end sleeve and requires no tools. Release is obtained by pressing the appropriate wire-releasing button.

Centring

The switch is provided with a wide centring inlet for the actuator pin. This solution makes it easier to align the actuator and the opening hole on the head during installation. Moreover, this solution drastically reduces the probability of a collision between the switch and the actuator, making it possible to install the device even on inaccurately closing doors.

Holding force of the locked actuator

9750 N The strong interlocking system guarantees a maximum actuator holding force of $F_{TEST} = 9750 \text{ N}$. This is one of the highest values currently available on the market today, making this device suitable for heavy-duty applications.

Dustproof

The switch is provided with a through hole for inserting the actuator. Thanks to this unique feature, any dust that enters the actuator hole can always come out on the opposite side instead of remaining inside. Moreover, the lock pin is provided with a diaphragm seal, making the system suitable for critical environments with a high level of dust.

Integrated control devices

The switch is also available with elevated cover. Control devices such as buttons, emergency stop buttons, indicator lights or selectors can thereby be attached directly to the switch together with corresponding contact blocks.

The result is a compact solution with direct access to control devices without needing to install them separately on the switch panel or in their own housing. The devices can be illuminated and, thanks to the PUSH-IN spring-operated connections, wiring is quick and intuitive.

The emergency-stop button is potentially exposed to the risk of accidental impacts due to its naturally protruding shape. A robust guard is available to protect the emergency-stop button from such impacts, integrated into the metal cover. This guard still guarantees optimal accessibility, with easy activation and resetting of the button.

Six LEDs for immediate diagnosis

As the LEDs have been designed for quick immediate diagnosis, the status of each input and output is highlighted by one specific LED. This makes it possible to quickly identify the interruption points in the safety chain, which device is released, which door is opened and any errors inside the device. All of this at a glance, without needing to decode complex flashing sequences.

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several guards are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked guards in their position with a retaining force of approx. 30 N, stopping any vibrations or gusts of wind from opening them.

Function for protecting against recoil forces

If a guard is closed too quickly or with so much force that the recoil would cause it to open again, a special function in the NG switch prevents locking. This function prevents the immediate locking of the guard if the lock signal is applied. This protects the switch against recoil forces that occur during instantaneous locking. This serves to protect the switch from damage and forces the operator to close the guard more gently.

Key release device and escape release button

The key release device (auxiliary release) is used to permit unlocking of the actuator only by personnel in possession of the key. The device also functions with no power supply and, once actuated, prevents the guard from being locked.

The escape release button allows actuator release and immediate opening of the guard. Generally used in machines

within which an operator could inadvertently become trapped, it faces towards the machine interior, to allow the operator to exit even in the event of a power failure. The button has two stable states and can be freely extended in length with suitable extensions (see accessories). Both devices can be positioned on the four sides of the switch. As a result, it can be installed both towards the interior and towards the exterior of the machine.

Three safety output actuation modes

MODE 1 MODE 2 MODE 3

The device is available with 3 different actuation modes for safety outputs:

- mode 1: safety outputs active with inserted and locked actuator, for machines with inertia;
- mode 2: safety outputs active with inserted actuator, for machines without inertia;
- mode 3: a first safety output active with actuator inserted and locked and a second safety output active with actuator inserted, for special applications.

Protection against tampering

Each actuator of the NG series is supplied with four snap-on protection caps. Not only do the caps prevent dirt from accumulating and simplify cleaning, they also block access to the fastening screws of the actuator. As a result, standard screws can be used instead of tamper-proof screws.

Jointed actuator for inaccurately closing guards

All NG series actuators are articulated, thereby allowing the actuator pin to be safely guided into the switch through the centring hole. As a result, the actuator and switch do not need to be precisely aligned during installation. In addition, the device can thereby be used on guards with a minimum actuation radius of 150 mm without the actuation pin needing to be angled.

Head and devices with variable orientation

The system can be variably configured by loosening the 4 screws on the head.

The key release device and the escape release button can also be rotated and secured independently of one another in steps of 90°. The device can thus assume 16 different configurations.

Non-detachable head and release devices

The head and the release device can be rotated but cannot be detached from each other. This makes the switch more secure since the problem of incorrect assembly by the installer cannot occur; in addition, the risk of damage is lower (loss of small parts, penetration of dirt, etc.).

High protection degree

IP69K IP67

These devices are designed to be used in the toughest environmental conditions and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing. Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

External device monitoring

EDM

On request, the switch can be supplied with EDM function (External Device Monitoring). In this case, the switch itself checks the proper function of the devices connected to the safety outputs. These devices (usually relays or safety contactors) must send a feedback signal to the EDM input, which checks that the received signal is consistent with the state of the safety outputs.

Selection diagram

Main features

- Actuation without contact, using RFID technology
- Digitally coded actuator
- Actuator holding force: 9750 N
- SIL 3 and PL e with a single device
- Metal housing, three M20 conduit entries
- Protection degree up to IP67 and IP69K
- PL e also with series connection of up to 32 devices
- Signalling LEDs

low	VN NG-F30
high	VN NG-F31

The use of RFID technology in NG series devices makes them suitable for several applications. Pizzato Elettrica offers two different versions of actuators, in order to best suit customers' specific needs.

Type F30 actuators are all encoded with the same code. This implies that a device associated with an actuator type F30 can be activated by other actuators type F30.

Type F31 actuators are always encoded with different codes. This implies that a device associated with an actuator type F31 can be activated only by a specific actuator. Another F31 type actuator will not be recognised by the device until a new association procedure is carried out (reprogramming). After reprogramming, the old actuator F31 will no longer be recognized.

Reprogramming of the actuator can be performed repeatedly.

Complete safety system

The use of complete and tested solutions guarantees the electrical compatibility between the NG series switches and the safety modules from Pizzato Elettrica, as well as high reliability. The switches have been tested with the modules listed in the adjacent table.

Switches	Compatible safety modules	Safety module output contacts		
		Instantaneous safety contacts	Delayed safety contacts	Signalling contacts
NG 2●●●●●	CS AR-01●024	2NO	/	1NC
	CS AR-02●024	3NO	/	/
	CS AR-05●024	3NO	/	1NC
	CS AR-06●024	3NO	/	1NC
	CS AR-08●024	2NO	/	/
	CS AT-0●●024	2NO	2NO	1NC
	CS AT-1●●024	3NO	2NO	/
	CS MP●●●●●	see page 89 of the General Catalogue PLCs & Safety Modules 2025–2026		
	CS MF●●●●●	see page 121 of the General Catalogue PLCs & Safety Modules 2025–2026		

NG series switches can be used as individual devices provided that the safety outputs be evaluated by a Pizzato Elettrica safety module (see table for combinable safety modules).

All NG series switches can be connected to safety modules or safety PLCs with OSSD inputs provided compatibility is ensured in advance.

Possibility of series connection of multiple switches for simplifying the wiring of the safety system, whereby only the outputs of the last switch are evaluated by a Pizzato Elettrica safety module (see table with compatible safety modules). Each NG series switch is provided with two signalling outputs which are activated when the guard is closed (O3) or locked (O4). Depending on the specific requirements of the system that has been realised, the signals of the signalling outputs can be evaluated by a PLC.

Possibility of series connection of multiple switches for simplifying the wiring of the safety system, whereby only the outputs of the last switch are evaluated by a Pizzato Elettrica safety module of the CS MP series. Both the safety-relevant evaluation and the evaluation of the signalling outputs are performed by the CS MP series. The examples listed above refer to applications with NG 2●●●4●●.

Internal wiring diagram

LED	Function
PWR	Power supply / self-diagnosis
IN	status of safety inputs
OUT	status of safety outputs
ACT	actuator state
LOCK	actuator locked
EDM	state of EDM input (NG 2D●●5●●)

The diagram on the side represents the 6 logic functions which interact inside the device. Function f0 is a basic function and includes the monitoring of the power supply as well as internal, cyclical tests. Function f1 monitors the status of the device inputs, whereas function f2 monitors the presence of the actuator within the detection areas of the switch. Function f4 checks the actuator lock condition. Function f3 is intended to activate or deactivate the safety outputs and check for any faults or short circuits in the outputs. In the EDM versions, the f5 function verifies the consistency of the EDM signal during safety output state changes. The safety-related function, which combines the sub-functions mentioned above, activates the safety outputs according to the chosen operating mode:

- Both safety outputs OS1/OS2 for switches in mode 1 are activated only if both IS1/IS2 safety inputs are active and the actuator is inserted and locked;
- Both safety outputs OS1/OS2 for switches in mode 2 are activated only if both IS1/IS2 safety inputs are active and the actuator is inserted;
- The safety output OS1 for switches in mode 3 is activated only if the IS1 safety input is active and the actuator is inserted and locked, whereas the safety output OS2 is activated only if the IS2 safety input is active and the actuator is inserted.

The status of each function is displayed by the corresponding LED (PWR, IN, OUT, ACT, LOCK, EDM), in such a way that the general device status becomes immediately obvious to the operator.

Actuation sequence in mode 1

The switch is supplied with power (PWR LED on, green), the IS1 and IS2 inputs are enabled (IN LED on, green), the OS1 and OS2 safety outputs are disabled (OUT LED off). The actuator is outside of the actuation zone (LED ACT off).

When the actuator is brought inside the safe actuation area (dark grey area), the switch turns on the ACT LED (green). In this position, the O3 signalling output (door-closed) is activated. The actuator is not locked (LOCK LED off).

The I4 input can be used to lock the actuator (LOCK LED on, green). The OS1 and OS2 safety outputs are enabled (OUT LED on, green). The O4 signalling output is activated at the same time. The safe actuation area is extended in order to allow greater play for the actuator.

The I4 input can be used to unlock the actuator (LOCK LED off). The switch disables the OS1 and OS2 safety outputs and turns off the OUT LED. The O4 signalling output is deactivated at the same time. The safe actuation area returns to the initial values.

When the actuator leaves the actuation limit area, the device turns off the ACT LED and the O3 signalling output.

Actuation sequence in mode 2 and mode 3

In contrast to the above mode 2 description, the safety outputs OS1 and OS2 are activated when the actuator is detected, and deactivated when the actuator is no longer detectable, in mode 3, the OS1 safety output is active with inserted and locked actuator and IS1 active, the OS2 safety output is active with inserted actuator and IS2 active.

Operating states

PWR LED	IN LED	OUT LED	ACT LED	LOCK LED	EDM LED (a)	Device state	Description
○	○	○	○	○	○	OFF	Device switched off.
●	●	●	●	●	●	POWER ON	Internal tests upon activation.
●	○	○	*	*	●	RUN	Safety inputs of the device not active.
●	●	*	*	*	*	RUN	Activation of safety inputs.
●	●	○	*	*	*	RUN	Safety inputs incoherence. Recommended action: check for presence and/or wiring of inputs.
●	*	*	●	*	*	RUN	Actuator in safe area. O3 signalling output active.
●	*	*	●	*	*	RUN	Actuator in limit area. Recommended action: move actuator closer.
●	*	*	●	●	○	RUN	Actuator in safe area and locked; O3 and O4 outputs active.
●	●	●	●	●	○	RUN	Mode 1 Activation of safety inputs IS1, IS2. Actuator in safe area and locked. O3, O4, OS1 and OS2 outputs active.
●	●	●	●	*	○	RUN	Mode 2 Activation of safety inputs IS1, IS2. Actuator in safe area. O3, OS1 and OS2 outputs active.
●	●	●	●	●	○	RUN	Mode 3 Actuator present, guard closed and locked, IS1 enabled, IS2 disabled, OS1 enabled, OS2 disabled.
●	●	●	●	○	○	RUN	Mode 3 Actuator present, guard closed and not locked, IS1 and IS2 enabled, OS1 disabled, OS2 enabled.
●	*	●	*	*	*	ERROR	Error on safety outputs. Recommended action: check for any short circuits between the outputs, outputs and ground or outputs and power supply, then restart the device.
●	○	○	●	○	○	ERROR	Actuator detection error. Check the physical integrity of the device and, in case of failure, please replace the entire device. If undamaged, realign the actuator with the switch and restart the device.
●	○	○	○	○	○	ERROR	Internal error. Recommended action: restart the device. If the failure persists, replace the device.
●	*	○	*	*	●	RUN	EDM signal active (external relay off) ^a
●	●	●	●	●	○	RUN	EDM signal not active (external relay on) ^a
●	○	○	○	○	●	ERROR	Error in the EDM ^a function

Legend: ○ = off ● = on ● = flashing ● = alternating colours * = indifferent
(a) Available for NG 2D●5●● versions only

External device monitoring (EDM)

The NG 2D●5●● version, in addition to maintaining the operating and safety characteristics of the NG series, allows control of **forcibly guided NC contacts of contactors or relays** controlled by the safety outputs of the switch itself. As an alternative to the relays or contactors you can use Pizzato Elettrica expansion modules CS ME-03. See page 79 of the General Catalogue PLCs & Safety Modules 2025–2026. This check is carried out via the EDM input (External Device Monitoring as defined in EN 61496-1) of the switch.

This version, with the IS safety inputs, **can be used at the end of a series of NG switches, up to a maximum number of 32 devices**, while maintaining the maximum PL e safety level and acc. to EN ISO 13849-1 and SIL 3 safety level acc. to EN IEC 62061.

This solution allows you to dispense with the safety module connected to the last device in the chain.

Connection with safety modules

Connections with CS AR-08•••• safety modules

Input configuration with monitored start
2 channels / Category 4 / up to SIL 3 / PL e

Connections with CS AR-05•••• / CS AR-06•••• safety modules

Input configuration with manual start (CS AR-05••••)
or monitored start (CS AR-06••••)
2 channels / Category 4 / up to SIL 3 / PL e

Connections with CS AT-0••••• / CS AT-1••••• safety modules

Input configuration with monitored start
2 channels / Category 4 / up to SIL 3 / PL e

Connections with CS MF•••••, CS MP••••• safety modules

The connections vary according to the program of the module
Category 4 / up to SIL 3 / PL e

Application example on page 87
General Catalogue - PLCs & Safety Modules 2025-2026

Series connection of several switches

Monitoring function: actuator locked
2 channels / Category 4 / up to SIL 3 / PL e

Single-channel control for locking function of the actuator
1 channel / Category 2 / up to SIL 2 / PL d

Monitoring function: actuator locked
2 channels / Category 4 / up to SIL 3 / PL e

Dual-channel control for locking function of the actuator
2 channels / Category 4 / up to SIL 3 / PL e

Connection terminals

PUSH-IN type spring-operated connection system

Cross-section of rigid/flexible wires w. wire-end sleeve:

min. $1 \times 0.34 \text{ mm}^2$ (1 x AWG 22)

max. $1 \times 1.5 \text{ mm}^2$ (1 x AWG 16)

Wire cross-section with pre-insulated wire-end sleeve:

min. $1 \times 0.25 \text{ mm}^2$ (1 x AWG 23)

max. $1 \times 0.75 \text{ mm}^2$ (1 x AWG 18)

Cable stripping length (x):

min.: 8 mm

max.: 12 mm

Pin assignments (version with standard cover NG 2D••••1A)

Internal terminal strip	M23 connector 12-pole	M12 connector 12-pole	M12 connector 8-pole stand-alone connection	M12 connector 8-pole series connection with "Y" connectors	Connection

OS2	16	4	4	4	OS2 Safety output
		7	7	7	

Important: terminals 7, 17, 18, of the internal terminal strip must not be used.

(a) Available in NG 2D•••5••• version only.

(b) For NG 2D•••6•••: the output signals the fault condition of the device.

(c) In single-channel actuation mode, inputs IE1 and IE2 must be short-circuited.

(d) In dual channel actuation mode, remove the internal bridge between terminals 8-9 and connect the wire from pin 12 to internal terminal 9.

(e) For NG 2D•••7••• articles: the signalling outputs O3 and O4 have negative operating logic (low active signal).

(f) Available for 8-pole connector, not available for the end of a chain with Y connectors.

Female connectors See page 353

Extensions for release button

Article	Description	Drawing
VN NG-LP30	Metal extension for release button. For max. wall thickness of 30 mm	
VN NG-LP40	Metal extension for release button. For max. wall thickness of 40 mm	
VN NG-LP50	Metal extension for release button. For max. wall thickness of 50 mm	
VN NG-LP60	Metal extension for release button. For max. wall thickness of 60 mm	
VN NG-ERB	Red metal release button	
VN NG-ERC	Compact red metal release button	
VN NG-ERP	Red technopolymer release button	
VN NG-ERX	AISI 316 stainless steel release button, unpainted. Guarantees a high resistance against corrosion and aggressive cleaning	

- Metal extensions can be combined with one another to achieve the desired length.
- Do not exceed an overall length of 500 mm between the release button and the switch. Make sure there is enough clearance between the release button and the wall so that it can be safely gripped and manually reset after it has been pressed.
- Use medium-strength thread locker to secure the extensions.

Adhesive labels for escape release button

Polycarbonate yellow adhesive, rectangular, 300x32 mm, red inscription. It has to be fixed on the internal part of the jamb and helps finding the escape release button.

Accessories

Article	Description
VF KLB300	Set of two locking keys
	Extra copy of the locking keys to be purchased if further keys are needed (standard supply: 2 units). The keys of all switches have the same code. Other codes on request.

Series connection

To simplify series connections of the devices, various M12 connectors are available that allow complete wiring.

This solution significantly reduces installation times while at the same time maintaining the maximum safety levels PL e and SIL 3.

For more information see page 361 of General Catalogue Safety Devices 2025-2026.

Maintained

Spring-return

Key extraction position

(a) with key

(b) without key

⁽¹⁾ The contacts in brackets are on request. Contact our technical department to verify the effective feasibility of the control device unit with the chosen combination of control devices.

⁽²⁾ The NO contact with spring-return is only activated if the emergency stop button reaches the limit of travel. The signal of the NO contact is captured by analysing the rising edge.

To order buttons with marking:

add the marking code indicated in the chapter Accessories on page 375 to the article codes.

Example: Black spring-return button with "O" engraving.

VN NG-AC27122 → VN NG-AC27122-L1

Technical data of the control devices

General data

Protection degree:	IP65 acc. to EN 60529
Mechanical endurance:	
Spring-return button:	1 million operating cycles
Emergency stop button:	50,000 operating cycles
Selector switch:	300,000 operating cycles
Key selector switch:	50,000 operating cycles
	30,000 operating cycles including removal of the key
Safety parameter B_{10D} :	130,000 (emergency stop button)

Actuating force

Spring-return button:	min. 4 N	max. 100 N
Emergency stop button:	min. 20 N	max. 100 N
Selector switch:	min. 0.1 Nm	max. 1.5 Nm
Key selector switch:	min. 0.1 Nm	max. 1.3 Nm

Contact blocks of the control devices

Material of the contacts:	silver contacts
Contact type:	Self-cleaning contacts with double interruption

Electrical data:

Thermal current I_{th} :	1 A
Rated insulation voltage U_i :	32 Vac/dc
Rated impulse withstand voltage U_{imp} :	1.5 kV
LED supply voltage:	24 Vdc $\pm$ 15%
LED supply current:	10 mA per LED

Utilization category of the contact block:

Direct current: DC13
U_e (V) 24
I_e (A) 0,55

Signalling contact with spring return:

Direct current: DC13
U_e (V) 24
I_e (mA) 10

In compliance with standards:

IEC 60947-5-1, IEC 60947-5-5, EN ISO 13850

Installation for safety applications:

Always connect the safety circuit to the **NC contacts** (normally closed contacts) as stated in standard EN 60947-5-1.

Description

These switches are used mainly on machines where the hazardous conditions persist even after the machine has been switched off. Mechanical parts such as pulleys, saw blades, etc., could continue to move after the machine is switched off. Thus, the switches can also be used if individual guards are only to be opened under certain conditions.

Versions with mode 1 and 3 (safety outputs active when guard closed and locked) are interlocks with guard locking acc. to ISO 14119; the product is labelled with the symbol shown.

Maximum safety with a single device

PL e + SIL 3

The NS series switches are constructed with redundant electronics.

As a result, the maximum PL e and SIL 3 safety levels can still be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a safety module with OSSD inputs or to a safety PLC.

Series connection of several switches

PL e + SIL 3

One of the most important features of the NS series is the possibility of connecting up to 32 sensors in series, while still maintaining the maximum safety levels PL e laid down in EN ISO 13849-1 and SIL 3 acc. to EN IEC 62061:2021.

This connection type is permissible in safety systems which have a safety module at the end of the chain that monitors the outputs of the last NS switch.

The fact that the PL e safety level can be maintained even with 32 sensors connected in series demonstrates the extremely secure structure of each single device.

Series connection with other devices

PL e + SIL 3

The NS series features two safety inputs and two safety outputs, which can be connected in series with other Pizzato Elettrica safety devices. This option allows the creation of safety chains containing various devices. For example, stainless steel safety hinges (HX BEE1 series), RFID sensors (ST series) and door lock sensors (NG series) can be connected in series while still maintaining the maximum PL e and SIL 3 safety levels.

RFID actuators with high coding level

The NS series is provided with an electronic system based on RFID technology to detect the actuator. This allows to provide each actuator with different coding and makes it impossible to tamper with a device by using another actuator of the same series. Millions of different coding combinations are possible for the actuators. They are therefore classified as high level coded actuators, according to EN ISO 14119.

The NS series is provided with an electronic system based on RFID technology to detect the actuator. This allows to provide each actuator with different coding and makes it impossible to tamper with a device by using another actuator of the same series. Millions of different coding combinations are possible for the actuators. They are therefore classified as high level coded actuators, according to EN ISO 14119.

Holding force of the locked actuator

2100 N The strong interlocking system guarantees a maximum actuator holding force of $F_{TEST} = 2100 \text{ N}$.

Dustproof

The switch is provided with a through hole for inserting the actuator. Thanks to this unique feature, any dust that enters the actuator hole can always come out on the opposite side instead of remaining inside. Moreover, the lock pin is provided with a diaphragm seal, making the system suitable for critical environments with a high level of dust.

Head and release devices with variable orientation, not detachable

The upper part of the switch, which contains the release devices, can be rotated and is permanently connected to the lower part, which contains the outputs for the electrical connection. After loosening the fastening screws, the individual modules can be rotated in 90° steps. As a result, a single device can be used to realise various configurations without the installation technician needing to concern himself with the correct assembly of various parts.

The fastening screws are provided with protection caps to prevent dirt build-up and thereby simplify cleaning.

Integrated control devices

The NS series switches are also available in a version with a long housing, that has room for fitting 1 to 4 control devices, with the relevant contact blocks, on the same body of the safety device. This version has the same modular and orientation features as the NS switches.

To meet requirements for a range of uses, a number of different colour and types of control devices can be adopted such as, for example: buttons, emergency stop buttons (also available with external protection guard), indicator lights, selector switches. Button lenses are customizable by laser engraving.

The control devices can be illuminated and protrude only slightly out of the housing thanks to the recessed housing hole.

The result is a compact solution with direct access to control devices without needing to install them separately on the switch panel or in their own housing.

Six LEDs for immediate diagnosis

As the LEDs have been designed for quick immediate diagnosis, the status of each input and output is highlighted by one specific LED. This makes it possible to quickly identify the interruption points in the safety chain, which device is released, which guard is opened and any errors inside the device. All of this at a glance, without needing to decode complex flashing sequences.

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several guards are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked guards in their position with a retaining force of approx. 20 N, stopping any vibrations or gusts of wind from opening them.

Protection against tampering

Each actuator of the NS series is supplied with four snap-on protection caps. Not only do the caps prevent dirt from accumulating and simplify cleaning, they also block access to the fastening screws of the actuator. As a result, standard screws can be used instead of tamper-proof screws.

Jointed actuator for inaccurately closing guards

All NS series actuators are articulated, thereby allowing the actuator pin to be safely guided into the switch through the centring hole. As a result, the actuator and switch do not need to be precisely aligned during installation. In addition, the device can thereby be used on guards with a minimum actuation radius of 150 mm without the actuation pin needing to be angled.

Function for protecting against recoil forces

If a guard is closed too quickly or with so much force that the recoil would cause it to open again, a special function in the NS switch prevents locking. This function prevents the immediate locking of the guard if the lock signal is applied. This protects the switch against recoil forces that occur during instantaneous locking, thus avoiding possible damage to the device.

Front and side mounting

Integrated in the housing of the NS series is a hole for inserting the actuator pin. Fixing holes are also provided in the robust body for front and side mounting.

This makes it easier to mount the switch during lateral installation: the switch is directly mounted without needing to rotate the module that contains the hole for inserting the actuator pin. The fixing holes can be sealed with the protection caps provided for this purpose. Dirt deposits and tampering attempts are thereby prevented.

Key release device and escape release button

The key release device (auxiliary release) is used to permit unlocking of the actuator only by personnel in possession of the key. The device also functions with no power supply and, once actuated, prevents the guard from being locked.

The escape release button allows actuator release and immediate opening of the guard. Generally used in machines within which an operator could inadvertently

become trapped, it faces towards the machine interior, to allow the operator to exit even in the event of a power failure. The button has two stable states and can be freely extended in length with suitable extensions (see accessories).

Both devices can be positioned on the four sides of the switch. As a result, it can be installed both towards the interior and towards the exterior of the machine.

High protection degree

IP69K
IP67

These devices are designed to be used in the toughest environmental conditions and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing. Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Three safety output actuation modes

MODE 1
MODE 2
MODE 3

The device is available with 3 different actuation modes for safety outputs:

- mode 1: safety outputs active with inserted and locked actuator, for machines with inertia;
- mode 2: safety outputs active with inserted actuator, for machines without inertia;

- mode 3: a first safety output active with actuator inserted and locked and a second safety output active with actuator inserted, for special applications.

External device monitoring

EDM

On request, the switch can be supplied with EDM function (External Device Monitoring). In this case, the switch itself checks the proper function of the devices connected to the safety outputs. These devices (usually relays or safety contactors) must send a feedback signal to the EDM input, which checks that the received signal is consistent with the state of the safety outputs.

Selection diagram

The use of RFID technology in NS series devices makes them suitable for several applications. Pizzato Elettrica offers two different versions of actuators, in order to best suit customers' specific needs.

Type F40 actuators are all encoded with the same code. This implies that a device associated with an actuator type F40 can be activated by other actuators type F40.

Type F41 actuators are always encoded with different codes. This implies that a device associated with an actuator type F41 can be activated only by a specific actuator. Another F41 type actuator will not be recognised by the device until a new association procedure is carried out (reprogramming). After reprogramming, the old actuator F41 will no longer be recognized.

Reprogramming of the actuator can be performed repeatedly.

Complete safety system

The use of complete and tested solutions guarantees the electrical compatibility between the NS series switches and the safety modules from Pizzato Elettrica, as well as high reliability. The switches have been tested with the modules listed in the adjacent table.

NS series switches can be used as individual devices provided that the safety outputs be evaluated by a Pizzato Elettrica safety module (see table for combinable safety modules).

Possibility of series connection of multiple switches for simplifying the wiring of the safety system, whereby only the outputs of the last switch are evaluated by a Pizzato Elettrica safety module (see table with compatible safety modules). Each NS series switch is provided with two signalling outputs which are activated when the guard is closed (O3) or locked (O4). Depending on the specific requirements of the system that has been realised, the signals of the signalling outputs can be evaluated by a PLC.

Possibility of series connection of multiple switches for simplifying the wiring of the safety system, whereby only the outputs of the last switch are evaluated by a Pizzato Elettrica safety module of the CS MP series. Both the safety-relevant evaluation and the evaluation of the signalling outputs are performed by the CS MP series.

The examples listed above refer to applications with NS ••••1•••.

Internal wiring diagram

LED	Function
PWR	Power supply / self-diagnosis
IN	status of safety inputs
OUT	status of safety outputs
ACT	actuator state
LOCK	actuator locked
EDM	state of EDM inputs (NS •5••1•••)

The diagram on the side represents the 7 logic functions which interact inside the device.

Function f0 is a basic function and includes the monitoring of the power supply as well as internal, cyclical tests. Function f1 monitors the status of the device inputs, whereas function f2 monitors the presence of the actuator within the detection areas of the switch.

Function f4 checks the actuator lock condition.

Function f3 is intended to activate or deactivate the safety outputs and check for any faults or short circuits in the outputs.

In the EDM versions, the f5 function verifies the consistency of the EDM signal during safety output state changes.

The safety-related function, which combines the sub-functions mentioned above, activates the safety outputs according to the chosen operating mode:

- Both safety outputs OS1/OS2 for switches in mode 1 are activated only if both IS1/IS2 safety inputs are active and the actuator is inserted and locked;
- Both safety outputs OS1/OS2 for switches in mode 2 are activated only if both IS1/IS2 safety inputs are active and the actuator is inserted;
- The safety output OS1 for switches in mode 3 is activated only if the IS1 safety input is active and the actuator is inserted and locked, whereas the safety output OS2 is activated only if the IS2 safety input is active and the actuator is inserted.

The f6 function verifies the coherence of the enable/disable signals of the actuator lock command.

The status of each function is displayed by the corresponding LED (PWR, IN, OUT, ACT, LOCK, EDM), in such a way that the general device status becomes immediately obvious to the operator.

All NS series switches can be connected, provided that compatibility is checked, to safety modules or safety PLCs with OSSD inputs.

Actuation sequence in mode 1

The switch is supplied with power (PWR LED on, green), the IS1 and IS2 inputs are enabled (IN LED on, green), the OS1 and OS2 safety outputs are disabled (OUT LED off). The actuator is outside of the actuation zone (LED ACT off).

When the actuator is brought inside the safe actuation area (dark grey area), the switch turns on the ACT LED (green). In this position, the O3 signalling output (door-closed) is activated. The actuator is not locked (LOCK LED off).

The IE1, IE2 inputs can be used to lock the actuator (LOCK LED on, green). The OS1 and OS2 safety outputs are enabled (OUT LED on, green). The O4 signalling output is activated at the same time. The safe actuation area is extended in order to allow greater play for the actuator.

The IE1, IE2 inputs can be used to unlock the actuator (LOCK LED off). The switch disables the OS1 and OS2 safety outputs and turns off the OUT LED. The O4 signalling output is deactivated at the same time. The safe actuation area returns to the initial values.

When the actuator leaves the actuation limit area, the device turns off the ACT LED and the O3 signalling output.

Actuation sequence in mode 2 and mode 3

In contrast to the above mode 2 description, the safety outputs OS1 and OS2 are activated when the actuator is detected, and deactivated when the actuator is no longer detectable, in mode 3, the OS1 safety output is active with inserted and locked actuator and IS1 active, the OS2 safety output is active with inserted actuator and IS2 active.

External device monitoring (EDM)

The NS •5••1••• version, in addition to maintaining the operating and safety characteristics of the NS series, allows control of forcibly guided NC contacts of contactors or relays controlled by the safety outputs of the switch itself. As an alternative to the relays or contactors you can use Pizzato Elettrica expansion modules CS ME-03 (see page 79 General Catalogue - PLCs & Safety Modules 2025-2026). This check is carried out via the EDM input (External Device Monitoring as defined in EN 61496-1) of the switch.

This version, with the IS safety inputs, can be used at the end of a series of NS switches, up to a maximum number of 32 devices, while maintaining the maximum PL e safety level and acc. to EN ISO 13849-1 and SIL 3 safety level acc. to EN IEC 62061.

This solution allows you to dispense with the safety module connected to the last device in the chain.

If present, the EDM function must be used.

Connection with safety modules

Connections with CS AR-08•••• safety modules

Input configuration with monitored start

2 channels / Category 4 / up to SIL 3 / PL e

Connections with CS AR-05•••• / CS AR-06•••• safety modules

Input configuration with manual start (CS AR-05••••) or monitored start (CS AR-06••••)

(a) Available for NS •••••1••• version only

(b) Available for 8-pole connector, not available for the end of a chain with Y connectors

Series connection

To simplify series connections of the devices, various M12 connectors are available that allow complete wiring.

This solution significantly reduces installation times while at the same time maintaining the maximum safety levels PL e and SIL 3 for the interlocking function.

For further information see page 361.

	30,000 operating cycles including removal of the key
Safety parameter B_{10D} :	130,000 (emergency stop button)

Actuating force

Spring-return button:	min. 4 N	max. 100 N
Emergency stop button:	min. 20 N	max. 100 N
Selector switch:	min. 0.1 Nm	max. 1.5 Nm
Key selector switch:	min. 0.1 Nm	max. 1.3 Nm

Contact blocks of the control devices

Material of the contacts:	silver contacts
Contact type:	Self-cleaning contacts with double interruption

Electrical data:

Thermal current I_{th} :	1 A
Rated insulation voltage U_i :	32 Vac/dc
Rated impulse withstand voltage U_{imp} :	1.5 kV
LED supply voltage:	24 Vdc $\pm$ 15%
LED supply current:	12 mA per LED

Utilization category of the contact block:

Direct current: DC-13
U_e (V) 24
I_e (A) 0,55

Signalling contact with spring return:

Direct current: DC13
U_e (V) 24
I_e (mA) 10

In compliance with standards:

IEC 60947-5-1, IEC 60947-5-5, EN ISO 13850

⚠ Installation for safety applications:

Always connect the safety circuit to the NC contacts (normally closed contacts) as stated in standard EN 60947-5-1.

Electrical data of M12 connector:

Max. operating voltage:	32 Vac/dc
Max. operating current:	max. 1.5 A

Electrical data of M23 connector:

Max. operating voltage:	32 Vac/dc
Max. operating current:	Max. 3 A

Accessories

Article	Description
VF KLB300	Set of two locking keys
	Extra copy of the locking keys to be purchased if further keys are needed (standard supply: 2 units).
	The keys of all switches have the same code. Other codes on request.

Lock-out device

Article	Description
LK S1D001	Lock-out device, mounting on the right side of the switch
LK S1S001	Lock-out device, mounting on the left side of the switch
	Device made entirely of metal, to be fixed on the side of NS switches without any additional plate or support.
	The front slider mechanically closes the actuator entry hole and functions as a shield for the RFID receiver antenna on the switch; thus ensuring an additional level of protection against accidental closure of the guard and untimely machine restart.
	Allows insertion of up to 5 padlocks with a 3.5 mm arc diameter.

⁽¹⁾ The contacts in brackets are on request. Contact our technical department to verify the effective feasibility of the control device unit with the chosen combination of control devices.

⁽²⁾ The NO contact with spring-return is only activated if the emergency stop button reaches the limit of travel. The signal of the NO contact is captured by analysing the rising edge.

To order buttons with marking:

add the marking code indicated in the chapter Accessories on page 375 to the article codes.

Example: Black spring-return button with "O" engraving.

VN NG-AC27122 → VN NG-AC27122-L1

Description

The safety switches of the NX series are the most compact on the market, making them the perfect solution for use in the smallest of spaces. These switches are used primarily on machines where the hazardous conditions remain for a while, even after the machines have been switched off; for example, mechanical parts such as pulleys, saw blades, etc., could continue to move, or parts of the machine could still be hot or under pressure. Thus, the switches can also be used if individual guards are only to be opened under certain conditions.

Versions with mode 1 (safety outputs active when guard closed and locked) are interlocks with guard locking acc. to

ISO 14119; the product is labelled with the symbol shown.

Bistable operating principle

The safety switch of the NX series is designed as bistable switch. This means that the internal solenoid that locks and unlocks the device does not operate in the normally de-energised or normally energized mode, but in the bistable mode, i.e., it is stably in the locked or unlocked position. The command for locking and unlocking continues to follow the "power-ON released" logic, i.e., as long as voltage is applied to the activation inputs of the solenoid, the actuator is unlocked. This approach offers numerous advantages, including, among others, the locked or unlocked state being retained even if the device should experience a power failure. Bistable operation of the internal solenoid ensures that the NX switch remains stably in the state to which it was last actuated.

Maximum safety with a single device

PL e + SIL 3

The NX series switches are constructed with redundant electronics. As a result, the maximum PL e and SIL 3 safety levels can still be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a safety module with OSSD inputs or to a safety PLC.

Series connection of several switches

PL e + SIL 3

One of the most important features of the NX series is the possibility of connecting up to 32 sensors in series, while still maintaining the maximum safety levels PL e laid down in EN ISO 13849-1 and SIL 3 acc. to EN IEC 62061. This connection type is permissible in safety systems which have a safety module at the end of the chain that monitors the outputs of the last NX switch. The fact that the PL e safety level can be maintained even with 32 sensors connected in series demonstrates the extremely secure structure of each single device.

Series connection with other devices

PL e + SIL 3

The NX series features two safety inputs and two safety outputs, which can be connected in series with other Pizzato Elettrica safety devices. This option allows the creation of safety chains containing various devices. For example, stainless steel safety hinges (HX BEE1 series), transponder sensors (ST series) and door lock sensors (NX series) can be connected in series while still maintaining the maximum PL e and SIL 3 safety levels.

RFID actuators with high coding level

The NX series is provided with an electronic system based on RFID technology to detect the actuator. This allows to provide each actuator with different coding and makes it impossible to tamper with a device by using another actuator of the same series. Millions of different coding combinations are possible for the actuators. They are therefore classified as high level coded actuators, according to EN ISO 14119.

Holding force of the locked actuator

6000 N

The strong interlocking system guarantees a maximum actuator holding force of $F_{TEST} = 6000 \text{ N}$.

Cover with multicolour signalling

The switches of the NX series are the only switches in their market segment equipped with a large, illuminated RGB-LED cover that enables the fast and immediate diagnosis of the function states. As a result, this display can also easily be read from a distance and from all viewing angles.

Metal head and technopolymer body

The housing of NX series switches is made of two materials:

- The metal head ensures maximum resistance to impacts from the actuator and resistance to pulling when the door is locked;
- The technopolymer body ensures a low weight and provides flexibility in the design. Hex-key auxiliary releases are mounted on the body, with versions featuring one front release or three releases located at the front and on the sides.

Output with cable or connector

The electrical connection via M12 connector, integrated cable or integrated cable with M12 connector, makes the device suitable for the most diverse applications. The connector versions allow faster device replacement and installation, by making incorrect wiring connection impossible. Versions with cable can be ordered with various cable lengths.

Three inputs for the actuators

The switch is always mounted using the two front screws, whereby it does not matter whether the doors open to the right or left or if they are sliding or hinged doors.

This is made possible by the three inputs for the actuator: one on the front and two on the sides. This eliminates the need to rotate the head or switch.

Switch mounting

loads from acting on the switch body.

The switch is fixed directly to the metal head with two M5 screws with a hole spacing of 20 mm. The arrangement of the fixing points near the actuator's point of traction allows the loads to be distributed on a robust and compact metal structure. This ensures that the switch can withstand considerable mechanical loads without being damaged or deformed in spite of its compact dimensions. Furthermore, this type of fixing prevents mechanical

Holding force of the unlocked actuator

15 N

several guards are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked guards in their position with a retaining force of approx. 15 N, stopping any vibrations or gusts of wind from opening them.

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where

Function for protecting against recoil forces

If a guard is closed too quickly or with so much force that the recoil would cause it to open again, a special function in the NX switch prevents locking. This function prevents the immediate locking of the guard if the lock signal is applied. This protects the switch against recoil forces that occur during instantaneous locking, thus avoiding possible damage to the device.

Jointed actuator for inaccurately closing guards

The actuator for the switches of the NX series is articulated, thereby allowing the actuator pin to be safely guided into the switch through the centring hole. As a result, the actuator and switch do not need to be precisely aligned during installation.

Rotatable actuator

The actuator of the NX series switches is equipped with fastening holes for M5 screws on both the front and the sides. Moreover, the two half shells that make up the actuator housing can be opened and the pin turned so that the working plane of the actuator can be rotated by 90°.

Guided insertion of the actuator

The actuator is always guided during insertion into the switch head. Any misalignments of the panels that arise during installation can thereby be corrected, thus ensuring precise and optimum positioning.

Protection against tampering

Each actuator of the NX series is supplied with snap-on protection caps. Not only do the caps prevent dirt from accumulating and simplify cleaning, they also block access to the fastening screws of the actuator. As a result, standard screws can be used instead of tamper-proof screws.

Two safety output actuation modes

MODE 1
MODE 2

The device is available with 2 different actuation modes for safety outputs:

- Mode 1: safety outputs active with inserted and locked actuator, for machines with inertia;
- Mode 2: safety outputs active with inserted actuator, for machines without inertia.

High protection degree

IP69K
IP67

These devices are designed to be used in the toughest environmental conditions and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing. Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

External device monitoring

EDM

On request, the switch can be supplied with EDM function (External Device Monitoring). In this case, the switch itself checks the proper function of the devices connected to the safety outputs. These devices (usually relays or safety contactors) must send a feedback signal to the EDM input, which checks that the received signal is consistent with the state of the safety outputs.

Code structure for actuator**VN NX-F60****Actuator**

F60	actuator with low coding level the switch recognises any type F60 actuator
F61	actuator with high coding level the switch recognises one single type F61 actuator

Main features

- Actuation without contact, using RFID technology
- Operating principle with bistable solenoid
- Cover with multicolour signalling
- Digitally coded actuator
- SIL 3 and PL e also with series connection of up to 32 devices
- Max. actuator holding force when locked: 6000 N
- SIL 3 and PL e with a single device
- Uniform fixing, independent of door type
- Protection degrees IP67 and IP69K

Quality marks:

EC type examination certificate: M6A 075157 0036

UL approval: E131787

TÜV SÜD approval: Z10 075157 0035

EAC approval: RU 4-IT-PA07.B.37848/24

ECOLAB approval: 0013/25

In compliance with standards:

EN ISO 14119, EN 60947-5-3, EN IEC 60947-1, EN 60204-1, EN ISO 12100, EN 60529, EN IEC 61000-6-2, EN IEC 61000-6-3, EN 61508-1, EN 61508-2, EN 61508-3, EN ISO 13849-1, EN ISO 13849-2, EN IEC 62061, EN IEC 61326-1, EN 61326-3-1, EN IEC 63000, ETSI EN 301 489-1, ETSI EN 301 489-3, ETSI EN 300 330-2, UL 508, CSA C22.2 No.14

Features approved by UL

Environmental ratings: Type 1, 12, 13.

Electrical ratings:

Main ratings: 24 Vdc Class 2, 0.25 A (output, two channels).

Secondary ratings:

Input Supplied by 24 Vdc Class 2, 0.8 A max.

Output 24 Vdc Class 2, 0.25 A (two channels, the same of main rating).

Auxiliary output 24 Vdc Class 2, 0.1A (two channels).

The minimum T off between two impulses to the coil is 6 seconds.

The models provided with M12 connector may be provided with the mating-connectors-part (with cord attached).

The VN NX locking actuator is an accessory for NX series.

Features approved by TÜV SÜD

Operating voltage: 24 Vdc $\pm 10\%$
 Ambient temperature: $-20^{\circ}\text{C} \dots +50^{\circ}\text{C}$
 Max. actuation frequency: 600 operating cycles/hour
 Max. holding force F_{ZH} : 3000 N
 Protection degree: IP67, IP69K

Tested in accordance with: 2006/42/EC, EN IEC 60947-5-2:2020/A11:2022, EN 60947-5-3:2013, EN 61508-1:2010 (SIL 2/3), EN 61508-2:2010 (SIL 2/3), EN 61508-3:2010 (SIL 2/3), EN IEC 62061:2021 (Maximum SIL 3), EN ISO 13849-1:2023 (Cat. 2/4, PL d/e), EN ISO 14119:2013.

Please contact our technical department for the list of approved products.

Technical data

Metal head, glass fibre reinforced technopolymer, self-extinguishing and shock-proof. Versions with 12x0.14 mm² or 8x0.25 mm² integrated cable, length 2 m, other lengths from 0.5 to 10 m on request.

Versions with integrated M12 stainless steel connector.

Versions with 2 m cable and M12 connector, other lengths from 0.1 ... 3 m on request.

Protection degree: IP67 acc. to EN 60529

IP69K acc. to ISO 20653 (Protect the cables from direct high-pressure and high-temperature jets)

Selection table for actuators

Coding level acc. to EN ISO 14119	Article
low	VN NX-F60
high	VN NX-F61

Type F60 actuators are all encoded with the same code. This implies that a device associated with an actuator type F60 can be activated by other actuators type F60.
Type F61 actuators are always encoded with different codes. This implies that a device associated with an actuator type F61 can be activated only by a specific actuator. Another F61 type actuator will not be recognised by the device until a new association procedure is carried out (reprogramming). After reprogramming, the old actuator F61 will no longer be recognized.
Reprogramming of the actuator can be performed repeatedly.

Operating states

Illumination of the cover	Device state	Description
	OFF	Device switched off.
	RUN	Actuator in safe area and locked. O3 and O4 signalling outputs active. In mode 1: with activation of the IS1 and IS2 safety inputs, the OS1 and OS2 safety outputs are activated.
	RUN	Actuator in safe area. O3 signalling output active. In mode 2: with activation of the IS1 and IS2 safety inputs, the OS1 and OS2 safety outputs are activated.
	RUN	Actuator outside of the activation zone.
	RUN	Actuator programming.
	ERROR	Internal error. Recommended action: restart the device. If the failure persists, replace the device.

Flash sequence of the cover	Device state	Description
	ERROR	Temperature error: The temperature of the device is outside of the permissible range.
	ERROR	Voltage error: the device supply voltage is outside permitted limits.
	ERROR	Error on safety outputs. Recommended action: check for any short circuits between the outputs, outputs and ground or outputs and power supply, then restart the device.
	ERROR	Actuator detection error. Recommended action: check the physical integrity of the device and, in case of failure, replace the entire device. If undamaged, realign the actuator with the device and restart the device.
	ERROR	Error in the EDM ⁽¹⁾ function
	WARNING	Warning: auxiliary release activated. Deactivate the auxiliary release to lock the actuator
	WARNING	Temperature warning: the device temperature is close to permitted limits.
	WARNING	Warning: movement of the solenoid pin is impeded or the solenoid is overheated
	WARNING	Voltage warning: the device supply voltage is close to permitted limits.
	WARNING	OSSD current warning: the current on the safety outputs is close to the permissible limit values.
	WARNING	Warning: no signal present at the safety inputs.
	WARNING	Warning: signals at the safety inputs inconsistent. Recommended action: check for presence and/or wiring of inputs.
	WARNING	Warning: inputs of the solenoids inconsistent. Recommended action: check for presence and/or wiring of inputs.
	SET	TAG programming finished

⁽¹⁾ Only available in the NX •5••••• versions

Actuation sequence in mode 1

The switch is supplied with power, the IS1 and IS2 inputs are enabled, the OS1 and OS2 safety outputs are disabled. The actuator is outside of the actuation zone (cover illuminates yellow).

If the actuator is brought inside the safe actuation zone (dark grey area), the cover illuminates light blue. In this position, the O3 signalling output (door-closed) is activated. The actuator is not locked.

The IE1 and IE2 inputs can be used to lock the actuator and the cover illuminates green. The OS1 and OS2 safety outputs are enabled. The O4 signalling output is activated at the same time. The safe actuation area is extended in order to allow greater play for the actuator.

The IE1 and IE2 inputs can be used to unlock the actuator (the cover illuminates light blue). The switch disables the OS1 and OS2 safety outputs. The O4 signalling output is deactivated at the same time. The safe actuation area returns to the initial values.

As soon as the actuator leaves the actuation zone, the device deactivates the O3 signalling output and the cover illuminates yellow.

Actuation sequence in mode 2

In contrast to the above mode 2 description, the safety outputs OS1 and OS2 enable when the actuator is detected, and disable when the actuator is no longer detectable.

Complete safety system

The use of complete and tested solutions guarantees the electrical compatibility between the NX series switches and the safety modules from Pizzato Elettrica, as well as high reliability. The switches have been tested with the modules listed in the adjacent table.

NX series switches can be used as individual devices provided that the safety outputs be evaluated by a Pizzato Elettrica safety module (see table for combinable safety modules).

Switches	Compatible safety modules	Safety module output contacts		
		Instantaneous safety contacts	Delayed safety contacts	Signalling contacts
NX1...	CS AR-01•024	2NO	/	1NC
	CS AR-02•024	3NO	/	/
	CS AR-05•024	3NO	/	1NC
	CS AR-06•024	3NO	/	1NC
	CS AR-08•024	2NO	/	/
	CS AT-0•024	2NO	2NO	1NC
	CS AT-1•024	3NO	2NO	/
	CS MP.....	see page 89 of the General Catalogue PLCs & Safety Modules 2025–2026		
	CS MF.....	see page 121 of the General Catalogue PLCs & Safety Modules 2025–2026		

All NX series switches can be connected, provided that compatibility is checked, to safety modules or safety PLCs with OSSD inputs.

Possibility of series connection of multiple switches for simplifying the wiring of the safety system, whereby only the outputs of the last switch are evaluated by a Pizzato Elettrica safety module (see table with compatible safety modules). Each NX series switch is provided with two signalling outputs which are activated when the guard is closed (O3) or locked (O4). Depending on the specific requirements of the system that has been realised, the signals of the signalling outputs can be evaluated by a PLC.

Possibility of series connection of multiple switches for simplifying the wiring of the safety system, whereby only the outputs of the last switch are evaluated by a Pizzato Elettrica safety module of the CS MP series. Both the safety-relevant evaluation and the evaluation of the signalling outputs are performed by the CS MP series.

The examples listed above refer to applications with NX1....

Internal wiring diagram

The diagram on the side represents the 7 logic functions which interact inside the device.

Function f0 is a basic function and includes the monitoring of the power supply as well as internal, cyclical tests. Function f1 monitors the status of the device inputs, whereas function f2 monitors the presence of the actuator within the detection areas of the switch.

Function f4 checks the actuator lock condition.

Function f3 is intended to activate or deactivate the safety outputs and check for any faults or short circuits in the outputs.

In the EDM versions, the f5 function verifies the consistency of the EDM signal during safety output state changes.

The safety-related function, which combines the sub-functions mentioned above, activates the safety outputs according to the chosen operating mode:

- Both safety outputs OS1/OS2 for switches in mode 1 are activated only if both IS1/IS2 safety inputs are active and the actuator is inserted and locked;
- Both safety outputs OS1/OS2 for switches in mode 2 are activated only if both IS1/IS2 safety inputs are active and the actuator is inserted;

The f6 function verifies the coherence of the enable/disable signals of the actuator lock command.

External device monitoring (EDM)

The NX •5•••1••• version, in addition to maintaining the operating and safety characteristics of the NX series, allows control of **forcibly guided NC contacts of contactors or relays** controlled by the safety outputs of the switch itself. As an alternative to the relays or contactors you can use Pizzato Elettrica expansion modules CS ME-03 (see page 79 General Catalogue - PLCs & Safety Modules 2025-2026). This check is carried out via the EDM input (External Device Monitoring as defined in EN 61496-1) of the switch.

This version, with the IS safety inputs, **can be used at the end of a series of NX switches, up to a maximum number of 32 devices**, while maintaining the maximum PL e safety level and acc. to EN ISO 13849-1 and SIL 3 safety level acc. to EN IEC 62061.

This solution allows you to dispense with the safety module connected to the last device in the chain.

If present, the EDM function must be used.

General data

The remote escape release is operated via a flexible cable and facilitates remote unlocking of the safety switch in cases where conventional release devices (lock-type, by screwdriver, push button, etc.) are not easily accessible due to the configuration of the machinery.

The remote escape release is particularly suitable in situations where the switch must be installed in a difficult-to-reach position, for example on top of a guard or inside a shield in order to prevent tampering. The remote escape release can be used with NG and NS series RFID safety switches with guard locks.

Self-monitoring of cable tension

Unlike other similar solutions on the market, the Pizzato Elettrica remote escape release is equipped with an innovative mechanical control system which safely stops the machinery, if the cable is cut or loosened.

When the device is activated, the square control indicator is positioned at the  symbol; in the event of a fault or anomaly, the square control indicator is positioned at the  symbol facilitating a quick diagnosis by the user.

Orientable device

The remote escape release device can always be oriented to one of the four sides of the switch by simply unscrewing the four fixing screws of the switch head. This feature of the NG and NS switches facilitates a unique degree of flexibility in the installation of this type of device.

The remote escape release device can also be ordered with four different cable exit orientations in order to choose the most suitable orientation for the application on the machine.

Standard devices are configured with the cable exit direction oriented downwards.

Flexible installation

The NG and NS safety switches with remote escape release are supplied with the respective device connected to the switch head and with a heavy-duty, five-metre-long steel cable which runs inside a sheath with a steel core.

The user can cut the cable and sheath to the required length in order to optimise the adaptation of the installation to the operational requirements.

The remote release push button, with code VN RR-K4, which must be ordered separately and to which the free end of the cable must be connected, is necessary for the completion of the assembly.

The push button has a sturdy internal metallic structure which is complemented by a small plastic housing, which creates a compact, aesthetically pleasing solution.

The housing can also be combined with a label displaying the VE TF ●●H●●● series marking to better indicate the function of the button.

Activation button for remote escape release

Article	Description
VN RR-K4	Activation button for remote escape release on NG and NS series switches

Mushroom push button for activating the remote escape release by means of a metallic cable, complete with plastic cover, with the option of affixing laser-marked labels from the Pizzato Elettrica Eround series.

Compact device with rugged internal metallic structure, ideal for flush installation on aluminium profiles starting from 30 mm.

Double mounting mode:

- fixed with screws to the outside of the guard chassis, closed by applying the cap (Figure A);
- fixed inside the guard chassis by means of the ring supplied, on a panel with a standard Ø 22 mm hole, leaving only the mushroom push button visible (Figure B).

Note: the actuation cable is integrated in the remote release device connected to the safety switch.

A. Installation outside the chassis

B. Installation inside the chassis, on a perforated panel

Complete kit for installation on NS series switches

Article	Description
VN RR-K1	Complete kit with connection block, cable and push button for mounting on NS series switches

The user can install the remote escape release directly into NS series safety devices that are already equipped with a front or rear release device (items NS ●●ST●●●, NS ●●SE●●●, NS ●●CE●●●) by means of the disassembly procedure for the upper switch block.

Attention: The installation of the VN RR-K1 accessory on series NS devices with an energised electromagnet operating principle is prohibited (items NS E●●●●●●, NS H●●●●●●, NS M●●●●●●).

General data

P-KUBE

Building on its decades of experience in the field of safety switches for machinery guards, Pizzato Elettrica presents the **P-KUBE** family of safety handles. These handles, with their characteristic simplicity, versatility, and robustness, constitute

an effective solution for machine builders and installers.

Robust, and compatible with all guard-locking switches, the P-KUBE safety handles can be used on all types of door – both hinged and sliding, left or right – with a unique product code; and they adapt with ease to all installation situations, thanks to metal brackets with adjustable slots.

P-KUBE **Krome**

- Modern and ergonomic design; fully concealed fixing screws and cabling.
- High anti bypass coding level, thanks to actuators with RFID technology.
- Tamper prevention, from interlocking protection caps inserted to fixing screw holes.
- Illuminated control button, built into grip, to request functions like opening, reset, start and others.
- Front grip customisable in various finishes.
- Compatible with NG and NS series safety locking switches with RFID technology.
- Compatible with lock-out devices for NG and NS series safety switches with RFID technology.

- Available also with integrated RGB LEDs, for local signalling of guard state.
- Ability to light up a single handle in green, yellow, red, blue, white, purple, and pale blue.

P-KUBE **Smart**

- Modern and ergonomic design; fully concealed fixing screws and cabling.
- High anti bypass coding level, thanks to actuators with RFID technology.
- Tamper prevention, from interlocking protection caps inserted to fixing screw holes.
- Illuminated control button, built into grip, to request functions like opening, reset, start and others.
- Front grip customisable in various finishes.
- Usable with ST series RFID safety sensors.
- Available also with integrated RGB LEDs, for local signalling of guard state.
- Ability to light up a single handle in green, yellow, red, blue, white, purple, and pale blue.
- Possibility of application with horizontal or vertical handle.
- Direct fixing on the grip or through solid inner plate.

P-KUBE 1

- Can be used with FD series safety switches with separate actuator without lock, and FG and FY series with lock.
- Robust metal self-centring pin, to ensure perfect alignment between door and jamb.
- Metal pin with mechanical door stop at limit of travel: no safety switch mechanical stress.
- Integral lock-out device to which a padlock can be fitted, to prevent accidental guard closure.

P-KUBE 2

- Can be used with NG series safety switches with lock and RFID technology.
- Increased locked actuator holding force: up to 9,750 N.
- Door retaining force (30 N) when door unlocked, to prevent accidental opening.
- High anti bypass coding level, thanks to actuators with RFID technology.
- Lock-out device available on request, to which a padlock can be fitted to prevent accidental guard closure.
- Dual safety lock-out: mechanical shielding, also of actuator RFID recognition.

P-KUBE Super

- Designed for installation in particularly demanding work environments (rolling mills, for example).
- Dual centring pin, ideal for heavier doors with significant misalignment.
- Can be used with NG series safety switches with lock and RFID technology.
- Increased locked actuator holding force: up to 9,750 N.
- Door retaining force (30 N) when door unlocked, to prevent accidental opening.
- Metal pin with mechanical door stop at limit of travel: no safety switch mechanical stress.
- High anti bypass coding level, thanks to actuators with RFID technology.
- Integral lock-out device to which a padlock can be fitted, to prevent accidental guard closure.

P-KUBE Fast

- Can be used with FD series safety switches with separate actuator without lock, and FG and FY series with lock.
- Compact, lightweight solution.
- Integrated internal lever for emergency guard opening.
- Sliding motion with internal mechanical stop, to prevent impacts between actuator and switch during closure.
- Integral lock-out device to which a padlock can be fitted, to prevent accidental guard closure.

**P-KUBE Lite**

- Can be used with FG and FY series safety switches with separate actuator with lock.
- Modern and ergonomic design.
- An innovative solution that simplifies installation and makes the handle compatible with both right-hand and left-hand doors.
- Strong centring pin compelling alignment between actuator and switch.
- Can be equipped with a block button that is automatically activated to block the grip when the handle is in the open position.
- Integral lock-out device to which a padlock can be fitted, to prevent accidental guard closure.
- Can be equipped with (coded) tubular or standard locking keys.
- Can be fitted with an optional lever enabling simple and rapid door opening from the inside in an emergency.
- Four holes enable attachment of up to four padlocks to prevent accidental closure of the guard.

[illegible]This image shows a full page of blank graph paper. The grid consists of small, equal-sized squares formed by thin, dark gray lines. There are 20 columns and 20 rows of squares, creating a total of 400 square units. The background is white, and the grid covers the entire area of the page.

Description

The **P-KUBE 1** safety handles are designed to install Pizzato Elettrica's FD, FG and FY series safety switches to machine guards quickly and easily, offering an effective solution to machine designers and installers for problems relating to the mechanical precision of guard movements.

The basic principle of this series of products is a mechanical centring and stop system along the direction of movement of the door. The centring system is extremely robust and can also be used in heavy duty applications or in the presence of careless personnel.

The lock-out device is used to block the door in the open position and prevent an unexpected system restart when maintenance personnel access the system.

Thanks to their adjustable design these handles can be installed on different types of doors or barriers: hinged or sliding, right or left closing, as well as on various types of profiles.

Robustness

Thanks to its particular design and its special materials the safety handle can be used in heavy duty applications and with sturdy wide-ranging guards (min. 700 mm).

- Mounting system made up of robust painted brackets with thicknesses of 4 and 5 mm.
- Single-body centring block in stainless steel
- Large diameter centring pin in stainless steel
- Max. holding force of the actuator equal to 3000 N (versions with FG series switches).

- Stainless steel tamper proof bolts and screws and elastic washers (safety inserts excluded, see page 229).

Mechanical stop

During door closing, the metal pin is flush to the bottom of the centring block (A) before the actuator can bump against the switch housing, leaving a safe distance (B), thus avoiding possible damage.

The metal pin is always flush on surfaces that transmit the impact to the frame and not to the switch, regardless of whether the lock-out device is open or closed.

Centring

The centring of the pin on the block (both in stainless steel) forces the alignment between actuator and switch, ensuring a proper insertion preventing any risk of collisions.

This also allows a safe re-alignment of the protection to the frame, even in case of big axial misalignments.

Holding force of the unlocked actuator

A version of the lock-out device with 100 N holding force is available on request. With this new optional feature, the handle is kept in its limit-stop closed position; a moderately energetic pull is required to open the door. This device is ideal for all applications where multiple doors are unlocked simultaneously but only one is actually opened; all unlocked doors are held in position, thereby preventing vibrations or gusts of wind from opening them.

Escape release button (FG and FY series)

The FG and FY series switches with actuator lock can be provided with an escape release button that, if oriented towards the inside of the machinery, allows accidentally trapped personnel to escape even during a blackout.

Pushing the button results in the same function as the auxiliary release device. To reset the switch, just return the button to its initial position.

The escape release button can be rotated and is available with different lengths. It is fixed to the switch by means of a screw allowing the installation of the switch both inside and outside the guards.

Impossible to bypass with a separate actuator

As soon as the lock-out device has been actuated and locked, the slot in the switch for the actuator is no longer accessible.

If an operator is in possession of a second, separate actuator, he is not able to bypass blocking of the device and actuate the switch.

Lock-out device

With a single operation, the lock-out device enables the closure of both the centring hole and the slot for the actuator present in the switch, thus making the mechanical closure of the door and the electrical commutation of the switch contacts impossible.

The lock-out device moves the red cover so that the holes in the cover do not coincide with the holes in the underlying metal block. This ensures that it is not possible to put a padlock on the device when it is open.

Up to 10 padlocks with a shackle diameter of up to 5 mm can be used.

Lock-out device open.
Safety switch is accessible.

Closing of the lock-out device.

Lock-out device closed.
Padlock insertion.

Lock-out device locked.
Padlock locked.
Safety switch is not accessible.

Turnable centring block

Thanks to its symmetrical design, the lock-out device can be installed on hinged and sliding doors, with both right and left closing, while still retaining its centring function and allowing for the attachment of multiple padlocks.

Flexibility and installation on different profiles

The slots of the three brackets applied on the door allow to carry out independent adjustments on 3 axes, providing an extremely easy installation and avoiding any modification of the existing protection structure. Thanks to these adjustments the handle can be installed on door profiles with different dimensions, from 40x40 mm to 60x60 mm (A) on the jamb and from 20x20 mm to 40x40 mm (B) on the door. The brackets are bolted together by means of anti-tampering screws.

Thanks to its vertical design, the bracket containing the safety switch and the lock-out device does not protrude beyond the jamb's profile.

Description

Together with the NG series RFID safety switches with guard locking, the **P-KUBE 2** safety handles form an integrated locking system for guards that enables access control to dangerous areas, offering an effective solution to designers and installers for problems related to the mechanical precision of the movements of the guard.

The basic principle of this product series is to use the self-centring properties of the actuator on the NG switch by means of hinge pins and a large insertion range into the device. The use of fixing plates with slotted holes also allows for easy and quick alignment of the switch and actuator.

The lock-out device is used to block the door in the open position and prevent an unexpected system restart when maintenance personnel access the system.

Thanks to their adjustable design these handles can be installed on different types of doors or barriers: hinged or sliding, right or left closing, as well as on various types of profiles.

Maximum safety with a single device

PL e+ SIL 3

The P-KUBE 2 safety handles can be combined with the NG series switches. As a result, the maximum PL e and SIL 3 safety levels can be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a safety module with OSSD inputs or to a safety PLC.

Easy to use

There are no specific sequences required for opening or closing the door, but only a single opening / closing movement.

If the door interlock is realised by means of a handle provided with a release push button, the door can be opened with a single movement even under stress (panic situations).

Holding force of the locked actuator

9750 N The strong interlocking system guarantees a maximum actuator holding force of $F_{1max} = 9750 \text{ N}$. This is one of the highest values currently available on the market today, making this device suitable for heavy-duty applications.

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several doors are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked doors in their position with a retaining force of 30 N, stopping any vibrations or gusts of wind from opening them.

Sturdiness and easy installation

The handle is provided with 5 mm thick sturdy brackets in painted steel. The slots in the brackets allow independent adjustments to be performed. This ensures easy installation, eliminating the need to make changes to structure of the existing guard.

The adjustments make it possible to attach the handle to aluminium profiles or steel frames of various dimensions, from 40 x 40 mm to 80 x 80 mm for the frame jamb (A) and from 20 x 20 mm to 40 x 40 mm for the door (B).

It can be installed both on hinged doors and sliding doors, either with right or left closing.

The handle is supplied with all of the components necessary for fastening at the appropriate distances with tamper-proof screws. The installer only has to assemble the components according to the application, fix the selected switch (supplied separately) and make centring adjustments.

Padlocking option for protecting against errors

The lock-out device is simply pushed downward to expose the holes for mounting padlocks. As a result, padlocks can no longer be mounted incorrectly, since the holes are not exposed until the switch is fully locked. 9 holes for padlocks with a diameter of 7 mm are present. The head of the switch can be quickly rotated in four different directions after loosening the fixing screws, while the lock-out device reliably protects on 3 sides. The lock-out device can thus be used on hinged and sliding doors – with both right and left closing – without any modification.

Lock-out: maximum safety with just one movement

With a single operation, the lock-out device can close the centring hole in the NG switch as well as shield the RFID recognition system for detecting the actuator. Accidental closing of the guard is thereby prevented by inhibiting both the mechanical locking of the door and the electrical switching of the switch contacts.

Head rotation

Because the lock-out device covers the switch head in the 3 possible approach directions, it can be used on hinged and sliding doors – with both right and left closing – without any additional modification.

Lock-out device for NG series switches

Lock-out device made entirely of metal to be installed with NG series switches with solenoid and RFID technology.

To prevent unintentional guard closure, simply move the black slider down so that the actuator entry hole is fully covered.

When the slider is lowered, a perforated plate emerges on the top of the device, allowing insertion of up to 9 padlocks.

The slider also serves as a shield for the RFID receiver antenna on the NG switch.

Description

The **P-KUBE Fast** safety handles are designed to install Pizzato Elettrica's FD, FG and FY series safety switches to machine guards quickly and easily, offering an effective solution to machine designers and installers for problems relating to the mechanical precision of guard movements, as well as for critical environmental conditions.

The P-KUBE Fast safety handles, unlike other products on the market, combine their compactness and lightness resulting from the sliding movement, with the robustness of the upper end models, which are distinguished by a higher weight, more bulky dimensions and greater constructive complexity.

Structure

The P-KUBE Fast handle is light and compact, has a galvanized and painted metal frame and an ergonomic plastic or aluminium grip for comfortable and easy use of the door handle itself.

The absence of screws and removable components prevents any tampering.

Handle lock positions

There is a snap-on device that retains the handle in two positions: when it is pulled out, so as to contribute to the retaining force exerted by the actuator, and when retracted, to avoid undesirable movements caused by machine vibrations.

Centring

The "C"-shaped profile facilitates centring of the device when closing a guard that is not perfectly aligned with the frame. This enables an optimum alignment between actuator and switch, preventing any damage due to possible collisions.

Flexibility during installation

Thanks to its symmetrical design the device can be installed on hinged and sliding doors, either with right or left closing, without requiring any further adjustment.

The slotted brackets and the large actuator travel (60 mm) allow the device to be installed and adjusted on profiles of various sizes.

Protection of actuator and switch

Thanks to the handle structure and the fixing bracket of the switch, both the switch and the actuator can be safely installed preventing any damage due to possible collisions. Any impacts resulting from incorrect actuation are completely absorbed on the handle frame.

Mechanical stop

During door closing, a mechanical stop (A) prevents possible impacts between the actuator and the switch by constantly ensuring a safety distance (B) between these two components and the switch housing.

Internal lever for emergency escape

Optional lever for emergency opening from the inside: it ensures that operating personnel can exit the area should they accidentally become trapped within the dangerous area. It can be combined only with switches without lock (e.g. FD •93-M2) or switches with escape release button (e.g. FG •••D6D••).

Lock-out device

The lock-out device integrated in the structure of the P-KUBE Fast handles allows up to 6 padlocks to be hooked in with a shackle diameter of 6 mm to prevent unintentional closing of the guard.

When the lock-out device is activated, the mechanical closing of the door and the electrical switching of the switch contacts is prevented.

The lock-out device can only be unlocked when all locks have been removed, i.e. when all operators have left the danger zone.

Code structure

Safety handle VF AP-S13BP-300

Safety handle VF AP-S13AP-301

Description

The P-KUBE Lite safety handle is compatible with Pizzato Elettrica FY and FG series safety switches, creating the perfect combination for a complete safety system. The intuitive

design and optimised ergonomics of the handle provide operators with a comfortable and secure grip. Sliding operation enables smooth and immediate use, minimising the amount of effort required to activate the safety switch. Equipped with a key lock, the handle enables installation of a "lock-out device" to increase the safety of the solution, reducing the risk of accidents or damage due to unauthorised access or accidental activation of the machine.

The handle and brackets are made of technopolymer and offer excellent resistance to impacts, wear and weathering, ensuring durability of the handle even in harsh environments.

Modern and ergonomic design

The P-KUBE Lite safety handle has been designed to combine safety and great aesthetics, for a solution that meets functional and design requirements, adopting the form of the P-KUBE Krome and P-KUBE Smart handles.

The refined design means that the handle fits seamlessly on machinery requiring a sleek look. It adds value to the overall design of the machinery, guaranteeing an attractive and sophisticated result.

Flexible installation

The symmetrical design of the P-KUBE Lite handle, which is unique in its segment, represents an innovative solution for simplified installation, making the handle compatible with right-hand or left-hand doors. This means that the handle is the same for any type of sliding or hinged door, whether it opens right or left, and regardless of its configuration. The sleek handle design without protruding parts not only improves its look but also increases safety and functionality.

Centring

The new handle features a strong centring pin at the front, which ensures alignment of actuator and switch, guaranteeing correct insertion without the risk of collision between the two components. This also allows a safe re-alignment of the guard to the frame, even in case of axial misalignments.

Immovable actuator

The P-KUBE Lite safety-handle actuator is fixed immovably to the handle body. This means that the installer is not required to assemble the actuator and it cannot be removed.

Block button

The P-KUBE Lite safety handle can be equipped with a block button that is automatically activated to block the grip when the handle is in the open position. This option ensures that the handle remains securely in the open position, preventing accidental or undesired displacements that could cause unwanted movement of the handle. The grip is released by simply pressing the block button. This simple and intuitive action allows the handle to return to its normal position, enabling movement and therefore insertion into the switch.

Key lock

The P-KUBE Lite safety handle can be equipped with (coded) tubular or standard locking keys. The lock secures the handle in the fully open position, preventing any accidental or unwanted movement. Only with the handle in the open position can operators remove the key and take it with them during machine maintenance.

Device for locking the handle in the open position

Four holes on the handle body enable attachment of up to four padlocks to prevent accidental closure of the guard. This means that up to four operators can enter the guard with the certainty that nobody can accidentally reclose the door before all of the operators have exited.

Lock-out: maximum safety with just one movement

The P-KUBE Lite handle can be fitted with a "lock-out device" on the switch support bracket, enabling use of up to 9 padlocks on 7 mm slotted holes to prevent accidental closing of the guard. When the "lock-out device" is active, the centring hole in the bracket and the slot in the switch for the actuator are closed in a single operation. This reliably prevents mechanical closing of the door and electrical commutation of the switch contacts. The "lock-out device" can be unlocked only when all of the padlocks have been removed, i.e. when all of the operators have left the danger zone, preventing accidental closing of the guard. The "lock-out device" fitted on the support bracket is a solution offering greater safety than a locking device integrated into the handle, as it prevents insertion of any back-up actuators into the switch.

Internal lever for emergency escape

The P-KUBE Lite safety handle can be fitted with an optional lever enabling simple and rapid door opening from the inside in an emergency. This function is essential to guarantee the safety of any personnel who have remained trapped inside a danger zone, allowing quick and efficient exit.

Protection against tampering

The P-KUBE Lite safety handle is supplied complete with snap-on protection caps to be applied to the holes of the fixing screws, so as to prevent access to them: therefore, standard screws can be used instead of tamper-proof screws, ensuring safety against tampering on the device. The caps also prevent the accumulation of soiling and facilitate the cleaning of the handle.

Accessories

Lock-out device for P-KUBE Lite handles

The P-KUBE Lite handle can be equipped with an optional lock-out device mounted on the switch support bracket. Lowering the moveable outer part of lock-out device, the centring hole in the bracket and the slot in the switch for the actuator are closed in a single operation. This reliably prevents mechanical closing of the door and electrical commutation of the switch contacts. With the lock-out device activated, it is possible to insert up to 9 padlocks: this feature makes the P-KUBE Lite handle with lock-out device particularly suitable for large and complex systems, in which the maintenance phases require the simultaneous entry of several operators into the hazardous areas.

Description

Together with the NG series RFID safety switches with guard locking, the **P-KUBE Super** safety handles form an integrated locking system for guards that enables access control to dangerous areas, offering an effective solution to designers and installers for problems related to the mechanical precision of the movements of the guard.

Designed as an evolution of the P-KUBE 2 handles, the P-KUBE Super handles with double centring pin are specifically designed for guards installed in heavy-duty work environments (e.g. rolling mills, iron and steel plants, etc.) where very heavy doors or doors with such dimensions as to generate high misalignments between the movable and fixed parts of the guard may be present.

The integrated lock-out device is used to block the door in the open position and prevent an unexpected system restart when maintenance personnel access the system.

Thanks to their adjustable design these handles can be installed on different types of doors or barriers: hinged or sliding, right or left closing, as well as on various types of profiles.

Maximum safety with a single device

PL e + SIL 3

The P-KUBE Super safety handles can be combined with the NG series switches. As a result, the maximum PL e and SIL 3 safety levels can be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a module suitable for managing devices with semiconductor outputs, or to a safety PLC.

Dual centring pin

When closing the guard, the upper metal pin attached to the handle plate hits the bottom of the centring block (A) before the actuator hits the switch housing, leaving a safe distance (B) to avoid collisions between the devices.

The upper metal centring pin can also only hit surfaces that transmit the impact to the support structure of the guard but not to the switch itself, which is thus relieved of all mechanical loads when the door is opened and closed.

The coupling with the actuators of the NG series with hinge pin allows further adaptation to the centring hole even with doors with inaccurate opening, thus avoiding continuous maintenance operations to realign the actuator and switch.

Sturdiness and easy installation

The handle is provided with 5 mm thick sturdy brackets in painted steel. The slots in the brackets allow independent adjustments to be performed. This ensures easy installation, eliminating the need to make changes to structure of the existing guard.

The adjustments make it possible to attach the handle to aluminium profiles or steel frames of various dimensions, from 40 x 40 mm to 80 x 80 mm for the frame jamb (A) and from 20 x 20 mm to 40 x 40 mm for the door (B).

It can be installed both on hinged doors and sliding doors, either with right or left closing.

The handle is supplied with all of the components necessary for fastening at the appropriate distances with tamper-proof screws. The installer only has to assemble the components according to the application, fix the selected NG series switch (supplied separately) and make centring adjustments.

Lock-out device

With a single operation, the lock-out device can close the centring hole, making it impossible to mechanically close the door.

Simply turn the red cover so that the centring hole is completely covered and the holes on the top of the cover match the holes in the metal block underneath.

With the lock-out device activated, it is possible to insert up to 12 padlocks with a shackle diameter of 5 mm; this feature makes the P-KUBE Super handle particularly suitable for large and complex systems, in which the maintenance phases require the simultaneous entry of several operators into the hazardous areas.

Holding force of the unlocked actuator

A version of the lock-out device with 100 N holding force is available on request. With this new optional feature, the handle is kept in its limit-stop closed position; a moderately energetic pull is required to open the door. This device is ideal for all applications where multiple doors are unlocked simultaneously but only one is actually opened; all unlocked doors are held in position, thereby preventing vibrations or gusts of wind from opening them.

Padlocking option for protecting against errors

The lock-out device is operated by a simple rotation of the slider to expose the holes for mounting padlocks. As a result, padlocks can no longer be mounted incorrectly, since the holes are not exposed until the switch is fully locked. 12 holes for padlocks with a diameter of 7 mm are present.

Lock-out device open.
Safety switch is accessible.

Closing of the
lock-out device.

Lock-out device closed.
Padlock insertion.

Lock-out device locked.

Article	Description
VF VAIT1T25	Bits for M5 screws with Torx T25 fitting
VF VAIT1T30	Bits for M6 screws with Torx T30 fitting

Description

Pizzato Elettrica is revolutionising the concept of safety handles, with the launch of the **P-KUBE Krome** series to the market.

This product series combines the characteristics of a robust handle for safety enclosures, with an ergonomic, rounded grip and customisable functions for the customer, with various illuminated signalling options, to reflect the state of the guard, or other operating conditions the manufacturer wishes to indicate. The new handles also allow integration of a control device (e.g. a button), directly in the grip.

The P-KUBE Krome safety handles are a built-in and innovative solution for machine manufacturers who, with a single product and wiring harness, can optimise the cost of components, by eliminating peripheral control boxes and illuminated signalling columns, and implementing aesthetically pleasing and exclusive guards – without compromising on the quality and reliability offered by Pizzato products.

Integrated control device

In the grip of the P-KUBE Krome handle, a spring-return button with 1NO contact can be integrated. This can be illuminated with a LED, and thus allows interaction with the machinery; for example to request guard opening, or transmit a reset command. The button is available in white, red, green, yellow, blue, and black.

Robustness

The internal fixing plate is made of painted steel, and 5 mm thick, to ensure locking system robustness, and increased service life.

Adaptability and flexibility

The same handle can be used on both hinged and sliding doors, with opening both on the right and on the left, simply by fixing the actuator on different levels.

Protection against tampering

The P-KUBE Krome handle is supplied complete with snap-on protection caps to be applied to the holes of the fixing screws, so as to prevent access: therefore, standard screws can be used instead of tamper-proof screws, ensuring safety against deliberate tampering on the device. The caps also prevent the accumulation of soiling and facilitate the cleaning of the handle.

Chrome-plated or illuminated grip

The grip is available with front strip in two finishes: satin chrome, and illuminated white. In the second version, the grip can be illuminated using RGB LED technology.

The modern, ergonomic design, combined with fully concealed fixing screws and wiring, allows implementation of machines and guards with particularly pleasing aesthetics.

Available versions

Thanks to the wide range of configurations available, the P-KUBE Krome safety handle can be ordered in the version that best suits the user's needs. Customization options apply to the grip, which can be supplied with or without a control device, or with or without RGB LED lighting. This feature allows you to find the most suitable product for a specific application or to diversify the handles that are installed on the same system, depending on the needs of machine designers and installers.

- Without control device
- Satin chrome grip non-illuminated

- Without control device
- White grip, can be illuminated with RGB LEDs

- With control device, can be illuminated
- Satin chrome grip non-illuminated

- With control device, can be illuminated
- White grip, can be illuminated with RGB LEDs

Customisable multicoloured illumination

The P-KUBE Krome handle, with illuminated grip, allows the machine manufacturer to locally signal the state of the guard by using various colours, and fully customisable sequences. Thanks to RGB LED technology, the handle illumination is visible from a large distance; even in brightly-lit environments. The device illuminates in colours: green, yellow, red, blue, white, purple, light blue.

Connections

The electrical connections are made through a cable that comes out at the back of the device and can therefore be easily housed inside the frame of the guard, so as to make it completely invisible. This feature has a double advantage: contributing to the aesthetics of the machine and ensuring that the cable is protected from damage and tampering.

The P-KUBE Krome handle is available with PVC cable connections or with cable and integrated M12 connector.

LK S lock-out device for NS series switches

Description

Article	Description
LK S1D001	Lock-out device for NS series switches, mounting on the right side of the switch
LK S1S001	Lock-out device for NS series switches, mounting on the left side of the switch

The range of P-KUBE Krome safety handles is completed by the lock-out device for NS series switches with solenoid and RFID technology. The device has a full metal design and is attached laterally to the holes on the NS device, without any auxiliary fixing plate or support.

The front slider, in addition to mechanically closing the actuator entry hole, also functions as a shield for the RFID receiver antenna on the NS switch; thus ensuring an additional level of protection against accidental closure of the guard and untimely machine restart. This is particularly effective, for example, for machines with an installed actuator with low coding level, making any attempt to bypass the switch impossible.

When the slider is lifted, a Ø 7 mm wide elongated eyelet emerges on the top of the device, allowing insertion of up to 5 padlocks.

General data

Error-proof operation

To prevent unintentional guard closure, simply move the red door upwards so that the actuator entry hole is fully covered, and the pin cannot be inserted.

Before entering the danger zone, each operator must insert his or her own personal padlock in the lock-out slot. This means that the lock-out device can be unlocked only once all padlocks have been removed; i.e., once all operators have exited the danger zone.

Lock-out disabled

Lock-out enabled

Maximum adaptability and compatibility

The precise engineering of the LK S lock out device has enabled implementation of a highly versatile product, able to easily adapt to all potential configurations of guards on which an NS series switch is used.

The unique shape of the slider that seals the actuator hole allows the LK S lock out device to be used on both hinged and sliding guards, on both left and right.

The lock-out and interlock switch are designed and manufactured for ideal compatibility with the new P-KUBE Krome handles by Pizzato Elettrica; allowing implementation of robust and functional protection systems, with an innovative aesthetic impact.

AP G1Z-000Z lock-out device for NG series switches

Description

Article	Description
AP G1Z-000Z	Lock-out device for NG series switches

Lock-out device made entirely of metal to be installed with NG series switches with solenoid and RFID technology, compatible with the P KUBE 2 and P KUBE Krome series safety handles.

To prevent unintentional guard closure, simply move the black slider down so that the actuator entry hole is fully covered. When the slider is lowered, a plate with Ø 7 mm holes emerges on the top of the device, allowing insertion of up to 9 padlocks.

The slider also serves as a shield for the RFID receiver antenna on the NG switch.

General data

Error-proof operation

With a single operation, the lock-out device can close the centring hole in the NG switch as well as shield the RFID recognition system for detecting the actuator. Accidental closing of the guard is thereby prevented by inhibiting both the mechanical locking of the door and the electrical switching of the switch contacts.

Maximum adaptability and compatibility

The symmetry of the AP G1Z-000Z lock-out device allows it to be used in all possible configurations of guards on which a switch of the NG series is used, without any type of adaptation and any modification to the mounting position.

The unique shape of the slider that seals the actuator hole allows the AP G1Z-000Z lock out device to be used on both hinged and sliding guards, on both left and right.

The lock-out and interlock switch are designed and manufactured for ideal compatibility with the new P-KUBE Krome handles by Pizzato Elettrica; allowing implementation of robust and functional protection systems, with an innovative aesthetic impact.

Dimensional drawings

Description

P-KUBE Smart safety handle can be used together with the RFID safety sensors of the ST series to create a modern and effective interlock system for all guards of machines without inertia.

This product series combines the characteristics of a robust handle for safety enclosures, with an ergonomic, rounded grip and customisable functions for the customer, with various illuminated signalling options, to reflect the state of the guard, or other operating conditions the manufacturer wishes to indicate.

Depending on user needs, the new handles also allow integration of a control device (e.g. a button), directly in the grip.

Adaptability and flexibility

The same article code can be used both on hinged doors and sliding doors, with an opening both on the right and on the left side. Furthermore, it is possible to install the handle with horizontal or vertical grip, so that it can also be mounted on doors or compact guards along the external frame.

Double fixing possibility

For applications on light or compact guards, it is possible to order the version with fixing directly on the handle using the two internal threaded inserts.

In the case of application on heavier guards, it is possible to fix the handle through an internal 5mm auxiliary plate, made of painted steel, to guarantee strength and long duration.

Chrome-plated or illuminated grip

The grip is available with front strip in two finishes: satin chrome, and illuminated white. In the second version, the grip can be illuminated using RGB LED technology.

The modern, ergonomic design, combined with fully concealed fixing screws and wiring, allows implementation of machines and guards with particularly pleasing aesthetics.

Integrated control device

In the grip of the P-KUBE Smart handle, a spring-return button with 1NO contact can be integrated. This can be illuminated with a LED, and thus allows interaction with the machinery; for example to request machine stop, or transmit a reset command. The button is available in white, red, green, yellow, blue, and black.

Protection against tampering

The P-KUBE Smart handle is supplied complete with snap-on protection caps to be applied to the holes of the fixing screws, so as to prevent access: therefore, standard screws can be used instead of tamper-proof screws, ensuring safety against deliberate tampering on the device. The caps also prevent the accumulation of soiling and facilitate the cleaning of the handle.

Connections

The electrical connections are made through a cable that comes out at the back of the device and can therefore be easily housed inside the frame of the guard, so as to make it completely invisible. This feature has a double advantage: contributing to the aesthetics of the machine and ensuring that the cable is protected from damage and tampering.

The P-KUBE Smart handle is available with PVC cable connections or with cable and integrated M12 connector.

Available versions

Thanks to the wide range of configurations available, the P-KUBE Smart safety handle can be ordered in the version that best suits the user's needs. Customization options apply to the grip, which can be supplied with or without a control device, or with or without RGB LED lighting. This feature allows you to identify the most suitable product for a specific application or to diversify the handles that are installed on the same system, depending on the needs of machine designers and installers.

- Without control device
- Satin chrome grip non-illuminated

- Without control device
- White grip, can be illuminated with RGB LEDs

- With control device, can be illuminated
- Satin chrome grip non-illuminated

- With control device, can be illuminated
- White grip, can be illuminated with RGB LEDs

Customisable multicoloured illumination

The P-KUBE Smart handle, with illuminated grip, allows the machine manufacturer to locally signal the state of the guard by using various colours, and fully customisable sequences. Thanks to RGB LED technology, the handle illumination is visible from a large distance; even in brightly-lit environments. The device illuminates in colours: green, yellow, red, blue, white, purple, light blue.

Universal handle

The P-KUBE Smart handle is also available in the version without RFID tag, so that it can be used as a simple handle to open a guard, regardless of the type of safety switch with which the door interlock is made of.

In this configuration, it is possible to use the versions with illuminated grip, to create an integrated visual signal system without the need to install further devices on board of the machine.

Compatible with P-KUBE Krome

Designed with the same handle size and the same interaxle spacings for the fixing holes of the inner plate, the P-KUBE Smart series can be used as inner handle in guards using the P-KUBE Krome safety handle for NS and NG series RFID safety switches with lock.

The mounting turns out to be practical and quick, as the two handles can be fixed by using only two holes passing through the frame and two screws of adequate length.

All these elements put together form a system with uniform lines and with aesthetic continuity between the inner and outer handle.

Notes

[illegible]A full page of blank graph paper with a uniform grid of small squares. The grid consists of 20 columns and 20 rows, creating a total of 400 small square units. The lines are thin and black, set against a white background. There are no margins, text, or other markings on the page.

Description

The rope switches from Pizzato Elettrica are the result of many years of experience and cooperation with major industrial machine manufacturers. The products can be used in nearly all industrial applications.

The product range includes solutions for general start/stop applications as well as for emergency stop switches. The emergency-stop rope switches were the first on the market to satisfy the requirements of EN ISO 13850 with patented solutions in a small size. The range of products offered by Pizzato Elettrica is complemented with appropriate accessories for safe and long-term use, even under difficult environmental conditions. Among the latest product innovations, the fastening and tensioning systems of the "FAST" line are worth mentioning (patented). At the focus of this development was the fast installation and an attractive design that blends harmoniously into the designs of current machine generations.

Conveyors

Sliding ladders

Rolling machines

Lift shaft pit

Long-span machinery

Complete perimeter protection

Rope switches are used to give different types of commands.

- **For stop commands**, rope switches with positive opening at medium rope tension are used; this also allows damage to the rope to be detected.
- **For emergency stop**, rope switches with positive opening in accordance with standard EN ISO 13850 are used. Here, the mechanical reset system opens the contact independent of the actuation speed of the rope, upon both actuation as well as breakage of the rope. With these switches, the reset system must be manually reset after each intervention.

	Requirements	Colours	How to install:
Stop commands  example: FD 1879-M2	Positive opening is required ⊕	Black is the colour suggested by standards for stop operations.	 The rope should be tensioned so as to enable detection of any breaks or stretching of the rope
Emergency stops  example: FD 1878-M2	Positive opening is required ⊕ Compliance with EN ISO 13850 is required	For emergency stops red rope is compulsory. A yellow background is recommended (see function indicator).	 The rope must be tensioned so as to enable detection of any breaks or stretching of the rope

Detection of an actuated or cut rope

Rope correctly mounted and in resting position, electric contacts closed.

Rope pulled by operator, electric contacts open.

Rope cut, electric contacts open.

Accessories for rope locking and tightening, "FAST" system

Pizzato Elettrica has developed and patented special accessories for more quickly installing the ropes of safety switches and at the same time creating a more aesthetically pleasing system.

Compared to the traditional fixing method, the new accessories offer the following advantages:

- The installation is faster because only one screw is used for the fastening of every rope extremity, and the parts are designed to ease the installation. Practical laboratory tests have shown that the installation time is reduced by over half, hence the name: "FAST".
- The system is aesthetically pleasant, because thread parts (which sometimes tear operators' dresses) and the rope extremities, usually fixed by heat-shrinkable sheath or adhesive tape, have been hidden.
- The rope is fixed without kinking and, as a result, does not stretch over time; re-calibration of the rope tension is no longer necessary.

The system has been tested for correct function only if used with steel ropes of high quality like the ones Pizzato Elettrica supplies.

Rope function indicator

These function indicators help in the visualization of the rope and its emergency function highlighting its presence as recommended by the standard EN ISO 13850 chap. 4.5.1 and 4.4.5.

They are fixed on the rope through screws and thanks to their handle-shape make the operation easier. The indicators can be supplied with different texts in several languages.

LED signalling lights

It is sometimes important to have an indicator that is visible on-site to indicate which rope switch has been actuated. The high luminosity LED signalling lights from Pizzato Elettrica were developed for this purpose and can be installed directly on the threaded cable glands of the switches. These signalling lights are robust and designed in protection degrees IP67 and IP69K. The inner part of the signalling light can rotate in such a way that it can be wired without any risk of twisting the wires. They are available for power supplies of 24 Vac/dc, 120 Vac and 230 Vac and can be delivered in red, green, yellow and white.

For more details see page 372.

Safety springs

For some applications, ropes are needed for covering especially long spans. With day/night changes of temperature, the ropes are lengthened or shortened in proportion to the rope length, to the change of temperature and to the coefficient of expansion of the steel.

With safety switches, the rope must be under tension within an operating tension range. As a result, an undesired actuation of the safety switch is possible with very long ropes or in the case of very high temperature differences. To reduce the effect of the changes of the temperature, it is possible to install a safety spring at the opposite extremity of the switch, so the rope elongation is equally divided between the two devices. The safety spring has been made to have an elastic coefficient equal to the spring inside the switch. In addition, the safety spring is equipped with a fixed ring that fully transfers the tensile force to the switch.

Stainless steel rope pulleys

The pulleys in stainless steel are used in applications where the rope is rather long, to support its length or bend its route. The two available pulleys are robust and dimensioned so as not to deform and to securely hold the rope in the guide even if the rope is pulled energetically. The angular pulley is available in a special design with a slotted fixing hole. This simplifies installation and ensures that the rope retains the correct distance from guard edges.

Safety modules

The rope safety switches inserted in the emergency chains can be connected with the Pizzato Elettrica safety modules in order to obtain safety circuits up to PL e in accordance with EN ISO 13849. Safety modules with instantaneous and delayed contacts are available for the realization of emergency circuits type 0 (immediate stop) or type 1 (monitored stop).

Main features

- Metal or plastic housing, from one to three conduit entries
- Protection degree IP67
- In compliance with EN ISO 13850
- 7 contact blocks available
- Versions with vertical or horizontal actuation
- Versions with assembled M12 connector
- Versions with gold-plated silver contacts

Description

These rope-operated safety switches are installed on machines or conveyor belts and allow the machine to be brought to an emergency stop from any point and with any pull on the rope. This means significant cost savings for medium and large machines, since multiple emergency-stop buttons can be replaced with a single switch. They are equipped with a self-control function that constantly checks the correct function and signals a possible loosening or breaking of the rope through the opening of the contacts. These safety switches keep the contacts open after activation until the reset is performed, even if the rope is released.

Heads with variable orientation

For all switches, the head can be adjusted in 90° steps after removing the four fastening screws.

Laser engraving

All devices are marked using a dedicated indelebible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

Protection degree IP67

IP67 These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Reduced actuating force

These switches can be supplied with reduced hardness internal springs on request. The force required to actuate the switch can thereby be reduced without changing the actuating path of the electrical contacts. This is particularly advantageous for smaller spans, but must, however, always make use of rope pulleys.

Indicator for rope adjustment

All switches are provided with a green ring that shows the area of the correct tightening of the rope. The installer has only to tighten the rope until the black indicator will be in the middle of the green area. With this setting, the switch can be reset by pulling the blue knob to close the electrical safety contacts.

If the tension (or loosening) on the rope is so high that the black indicator exits the green area, the electrical safety contacts will open and the reset device will trigger.

Indicator for the state of the reset

If the tension indicator is in the green area, the electrical safety contacts can be closed by pulling the blue knob. The reset status can be identified quickly by the green ring under the blue knob.

Features approved by IMQ

Rated insulation voltage (U _i):	500 Vac 400 Vac (for contact blocks 20, 21, 22, 33, 34)
Conventional free air thermal current (I _{th}):	10 A
Protection against short circuits:	type aM fuse 10 A 500 V
Rated impulse withstand voltage (U _{imp}):	6 kV 4 kV (for contact blocks 20, 21, 22, 33, 34)
Protection degree of the housing:	IP67
MV terminals (screw terminals)	
Pollution degree:	3
Utilization category:	AC15
Operating voltage (U _e):	400 Vac (50 Hz)
Operating current (I _e):	3 A
Forms of the contact element:	Zb, Y+Y, Y+Y+X, Y+Y+Y, Y+X+X.
Positive opening contacts on contact blocks	9, 18, 20, 21, 22, 33, 34.
In compliance with standards:	EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU, EN 60947-5-5.

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings:	Q300 pilot duty (69 VA, 125-250 V dc) A600 pilot duty (720 VA, 120-600 V ac)
Environmental Ratings:	Types 1, 4X, 12, 13
Use	60 or 75°C copper (Cu) conductor and wire size range 12, 14 AWG, stranded or solid.
The terminal tightening torque of	7.1 lb in (0.8 Nm).
For FP series: the hub is to be connected to the conduit before the hub is connected to the enclosure.	

Please contact our technical department for the list of approved products.

Maximum spans

Maximum spans for switches with longitudinal head

The max. recommended spans are indicated in the diagram as a function of the temperature fluctuations (temperature differences) to which the switch may be exposed at the point of use. For instance, with installation of type C and a temperature difference of 30°C, the max. recommended rope length is 10 metres.

Maximum spans for switches with transversal head

Important: The above data are guaranteed only using original rope and accessories. See page 289.

Adjustment of the switching point

Tighten the rope connected to the switch, until the end of the indicator (1) reaches about the middle of the green ring (2).

Pull the knob (3) in order to close the safety contacts inside the switch. Below the knob a green ring (4) will be disclosed.

Pre-installed cable glands or connectors

	no cable gland or connector (standard)
K23	cable gland for cables Ø 6 ... 12 mm
...	...
K50	M12 metal connector, 5-pole
...	...

For the complete list of possible combinations please contact our technical department.

Threaded conduit entry

M2	M20x1.5 (standard)
M1	M16x1.5 (FR-FX housing only)
	PG 13.5
A	PG 11 (FR-FX housing only)

Ambient temperature

	-25°C ... +80°C (standard)
T6	-40°C ... +80°C

Main features

- Metal or plastic housing, from one to three conduit entries
- Protection degree IP67
- 7 contact blocks available
- Versions with vertical or horizontal actuation
- Versions with assembled M12 connector
- Versions with gold-plated silver contacts

Quality marks:

IMQ approval:	EG605 (FD-FL-FP-FC series) EG610 (FR-FX-FM series)

Description

These rope-operated safety switches are installed on machines or conveyor belts and facilitate the simple shut-down of the machine from any point and with any pull on the rope.

Provided with self-control function, they allow the constant monitoring of correct functioning, signalling with the opening of the contacts an eventual loosening or breaking of the rope.

Heads with variable orientation

For all switches, the head can be adjusted in 90° steps after removing the four fastening screws.

Protection degree IP67

IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529.

They can therefore be used in all environments where the maximum degree of protection is required for the housing.

Extended temperature range

-40°C

These devices are also available in a special version suitable for an ambient operating temperature range from -40°C up to +80°C.

They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

Indicator for rope adjustment

electrical safety contacts will open.

The switches (head 79 and 80) are provided with a green ring that shows the area of the correct tightening of the rope. The installer has only to tighten the rope until the black indicator will be in the middle of the green area. If the tension (or loosening) on the rope is so high that the black indicator exits the green area, the elec-

Actuating forces

These switches can be supplied with reduced hardness internal springs on request. The force required to actuate the switch can thereby be reduced without changing the actuating path of the electrical contacts. This is particularly advantageous for smaller spans, but must, however, always make use of rope pulleys.

Features approved by IMQ

Rated insulation voltage (Ui):	500 Vac 400 Vac (for contact blocks 2, 11, 12, 20, 21, 22, 28, 29, 30, 33, 34, 37)
Conventional free air thermal current (Ith):	10 A
Protection against short circuits:	type aM fuse 10 A 500 V
Rated impulse withstand voltage (U _{imp}):	6 kV 4 kV (for contact blocks 20, 21, 22, 28, 29, 30, 33, 34)
Protection degree of the housing:	IP67
MV terminals (screw terminals)	
Pollution degree:	3
Utilization category:	AC15
Operating voltage (Ue):	400 Vac (50 Hz)
Operating current (Ie):	3 A
Forms of the contact element: Za, Za+Za, X+X, Zb, Y+Y, Y+Y+X, Y+Y+Y, Y+X+X, Y, X.	
Positive opening of contacts on contact blocks 5, 6, 7, 8, 9, 11, 13, 14, 16, 17, 18, 19, 20, 21, 22, 28, 29, 30, 33, 34, 37, 38, 39, 66.	
In compliance with standards: EN 60947-1, EN 60947-5-1, fundamental requirements of the Low Voltage Directive 2014/35/EU.	

Please contact our technical department for the list of approved products.

Features approved by UL

Electrical Ratings:	Q300 pilot duty (69 VA, 125-250 V dc) A600 pilot duty (720 VA, 120-600 V ac)
Environmental Ratings:	FR: Types 1, 4X FD, FP, FC, FM, FX, FL: Types 1, 4X, 12, 13
Use 60 or 75°C copper (Cu) conductor and wire size range 12, 14 AWG, stranded or solid.	
The terminal tightening torque of 7.1 lb in (0.8 Nm).	
For FR, FP, FX series: the hub is to be connected to the conduit before the hub is connected to the enclosure.	

Please contact our technical department for the list of approved products.

How to read travel diagrams

IMPORTANT:

In **safety applications**, actuate the switch **at least up to the positive opening travel** shown in the travel diagrams with symbol ⊕. Actuate the switch **at least with the positive opening force**, reported in brackets below each article, next to the actuating force value.

Travel diagrams table

Contact block	Group 1	Group 2	Group 3
8 1NC			
9 2NC			
18 1NO+1NC			
20 1NO+2NC			
21 3NC			
22 2NO+1NC			
33 1NC+1NO			
34 2NC			

In the rest position (with rope correctly tightened) the two contacts of **contact block 8** are both closed and are activated respectively by tightening or loosening the rope. In order to use this contact block for safety applications it is necessary to connect the two contacts in series. For this reason, in the wiring diagrams the **contact block 8** is indicated as 1NC, whereas in travel diagrams both contacts are indicated.

Application examples and max. rope length for switches with longitudinal head

Example A

Example B

Example C

Example D

Example E

Application examples and max. rope length for switches with transversal head

Example F

Example G

Example H

Example I

Example J

Maximum spans

Maximum spans for switches with longitudinal head

The max. recommended spans are indicated in the diagram as a function of the temperature fluctuations (temperature differences) to which the switch may be exposed at the point of use. For instance, with installation of type C and a temperature difference of 30°C, the max. recommended rope length is 10 metres.

Maximum spans for switches with transversal head

Important: The above data are guaranteed only using original rope and accessories. See page 289.

Adjustment of the switching point

For switches with head 79 and 80: Tighten the rope connected to the switch, until the end of the indicator (1) reaches about the middle of the green ring (2).

For switches with head 74: Tighten the rope connected to the switch until the thimble will be at about 4 mm from the head.

Main features

- Protection degrees IP67 and IP69K
- Stainless steel captive screws
- 4 side cable entries
- Screw caps included in the scope of supply

Quality marks:

EAC approval: RU д-IT.PA07.B.37848/24

Technical data

Housing

Material:

Self-extinguishing shock-proof polycarbonate with double insulation, UV-resistant and glass fibre reinforced, high shock resistance.

Material of the screws:

Stainless steel

Conduit entries:

4x knock-out side entries:
N°2 M20 - 1/2 NPT, N°2 M20 - 1/2NPT - M25
2x M16 knock-out base entries

Emergency stop button

Mechanical endurance:

300,000 operating cycles

Max. actuation frequency:

3600 operating cycles/hour

Actuation travel:

4 mm (NO contact),
4 mm (NC contact)

Actuating force:

25 N

Actuating force at limit of travel:

Push-pull 18.5 N (without contacts)
Rotary release, 35 N (without contacts)

Maximum travel:

9 mm

Tightening torque of the fixing ring:

2 ... 2.5 Nm

General data

Protection degree:

IP67 acc. to EN 60529 (with cable gland of equal or higher protection degree)

IP69K acc. to ISO 20653

(only for versions without luminous disc)

Ambient temperature:

-25°C ... +80°C

Tightening torque of the cover screws:

1 ... 1.4 Nm

Utilization requirements:

see page 179 of the General Catalogue HMI2025-2026

In compliance with standards:

IEC 60947-1, IEC 60947-5-1, IEC 60204-1, EN 60947-1, EN 60947-5-1, EN 60204-1, EN IEC 63000, EN ISO 13850, UL 508, CSA C22.2 No. 14.

Compliance with the requirements of:

Machinery Directive 2006/42/EC, EMC Directive 2014/30/EU, RoHS Directive 2011/65/EU.

General data

Protection degrees IP67 and IP69K

IP69K
IP67

These devices are designed to be used under the toughest environmental conditions, and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where the maximum degree

of protection is required for the housing. Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Fixing of EROUND housings

The housings of the EROUND line by Pizzato Elettrica have 4 additional holes on the cover. The holes enable wall fixing from the outside by means of insertion of the screws, without the need to open the cover to access the holes.

The wall fixing screws and the ones for closing the housing cover can be sealed with 4 caps (supplied with the housing). The caps not only give the housing a more pleasant look, but they also prevent the accumulation of dirt inside the recesses of the screws besides making tampering more difficult.

The external fixing of the housings is particularly valuable for already wired housings, since this simplifies the whole installation: you can simply fix the housing and connect the connector that, thanks to the presence of cable entries on the four sides of the housing, can be oriented in the preferred direction.

One housing, two solutions

The housing can fit up to 3 contact blocks/LED units (E2 CP, E2 LP) for panel mounting by means of a mounting adapter (A) or up to 3 contact blocks/LED units (E2 CF, E2 LF) for base mounting directly on the bottom of the housing (B).

Wiring through the lower surface

cable gland	F
M16	Ø 25
M20	Ø 28

Housings have 2 conduit entries on the lower surface. Cables can be connected via this surface, hiding them from view.

Spare caps

Article	Description
 VETS35RA1	4 spare caps for ES series housing cover. Colour: yellow
 VETS39RA1	4 spare caps for ES series housing cover. Colour: grey

Accessories

→ More ACCESSORIES on page 175 of the General Catalogue HMI 2025-2026

Dimensional drawings

All values in the drawings are in mm

Accessories See page 353

→ The 2D and 3D files are available at www.pizzato.com

Main features

- Protection degrees IP67 and IP69K
- Stainless steel captive screws
- 4 side cable entries
- Screw caps included in the scope of supply
- Cover with illuminated upper guard
- Version with white cover and RGB LED
- Version with yellow cover also suitable for use in lift sector
- Integrated buzzer

Quality marks:

EAC approval: RU д-IT.PA07.B.37848/24

Technical data

Housing

Material:

Self-extinguishing shock-proof polycarbonate with double insulation, high shock resistance.

Material of the screws:

Stainless steel

Conduit entries:

4x knock-out side entries:
2x M20 - 1/2 NPT, 2x M20 - 1/2NPT - M25
2x M16 knock-out base entries

General data

Protection degree:

IP67 acc. to EN 60529 (with cable gland of equal or higher protection degree)

IP69K acc. to ISO 20653 (only for versions without luminous disc)

Tightening torque of the cover screws:

1 ... 1.4 Nm

Rated operating voltage U_e :

24 Vdc $\pm 10\%$ SELV/PELV

Operating current at U_e voltage:

50 mA (white LEDs)

120 mA (RGB LEDs)

Sound intensity:

80 dB at 10cm

Blinking frequency:

1Hz (0.5 s ON and 0.5 s OFF)

Ambient temperature:

-25 °C ... + 80 °C

Connection type:

PUSH-IN spring-operated connection

Cable cross section:

min. 1 x 0.34 mm² (1 x AWG 24)

max. 1 x 1.5 mm² (1 x AWG 16)

Cable stripping length:

min. 8 mm

max. 12 mm

Utilization requirements:

see page 179 of the General Catalogue HMI 2025-2026

In compliance with standards:

IEC 60947-1, IEC 60947-5-1, IEC 60204-1, EN 60947-1, EN 60947-5-1, EN 60204-1, EN IEC 63000, EN ISO 13850, UL 508, CSA C22.2 No. 14.

Compliance with the requirements of:

Machinery Directive 2006/42/EC, EMC Directive 2014/30/EU, RoHS Directive 2011/65/EU.

General data

Introduction

The new housing with illuminated guard and buzzer features a cover with illuminated device protection guard and buzzer for acoustic signals. These features make it easy to identify. The natural use for this housing is with an emergency stop button. However, the housing

can also be used with other devices, such as selector switches. The integrated guard protects the button from dust and avoids accidental activation, whilst enabling the emergency stop button to be easily reset. The illuminated cover makes the housing easy to identify on the machine, while the integrated buzzer can be configured to warn the operator when the emergency stop button has been pressed. The cover is available in two colour variants: yellow or white.

Buzzer

80dB

All housings can be equipped with a buzzer featuring selectable continuous or intermittent operation.

Version with white RGB illuminated cover

The housing with white cover is equipped with an RGB LED and can be illuminated with different colours.

Version with yellow illuminated cover

The housing with yellow cover lights up yellow when illuminated and can also be used for applications in the lift sector.

Wiring of the housing

The box can be wired using the internal terminal strip, enabling selection of continuous or intermittent modes for the light and acoustic signals. Alternatively it can be ordered pre-wired with an M12 connector.

White housing with selector

The housing can also be paired with other devices, such as multiple-position selectors.

BN AC3ZA01

Number of devices

1	1 device
2	2 devices
3	3 devices
4	4 devices
6	6 devices
7	7 devices
8	8 devices

Button and connector configuration

A01	A01 configuration
A02	A02 configuration
A03	A03 configuration
...	other configurations on request

Main features

- Modular control device unit for 1 to 8 devices
- Rotatable fixing position
- Flush-mounted control devices
- Compact dimensions, minimal housing width
- Numerous control devices available

Quality marks:

UL approval:

E131787

Features approved by UL

Electrical ratings: 24 Vdc Class 2, 0.1 A

Model BN with base module dimensions 40 mm by 38.5 mm by 145.5 mm:

Input Supplied by 24 Vdc, Class 2 Source or limited voltage limited energy, 0.096 A max. (Maximum eight leds).

Output 24 Vac/dc "Class 2" 0.25 A Pilot Duty (Maximum eight Actuators, with maximum twelve contacts, NO or NC or both) or 0.18 A Pilot Duty (Maximum eight Actuators, with maximum sixteen contacts, NO or NC or both)

Model BN with base module dimensions 40 mm by 38.5 mm by 82.1 mm:

Input Supplied by 24 Vdc, Class 2 Source or limited voltage limited energy, 0.048 A max. (Maximum four leds).

Output 24 Vac/dc "Class 2" 0.25 A Pilot Duty (Maximum four Actuators, with maximum eight contacts, NO or NC or both) or 0.18 A Pilot Duty (Maximum four Actuators, with maximum eight contacts, NO or NC or both)

Environmental ratings: Type 1

Technical data

Housing made of glass fibre reinforced technopolymer, self-extinguishing and shock-proof
Versions with 12x0.14 mm² or 8x0.25 mm² integrated cable, length 2 m, other lengths from 0.5 to 10 m on request

Versions with integrated M12 stainless steel connector, single or double, or with M23 connector

Versions with 2 m cable and M12 connector, other lengths from 0.1 ... 3 m on request

Protection degree: IP65 acc. to EN 60529

General data

Ambient temperature:	-25°C ... +70°C
Storage temperature:	-40°C ... +80°C
Fixing screws for the housing:	2 x M5, tightening torque 3 Nm
Fixing screws for turnable modules:	Tightening torque of 0.8 ... 1.2 Nm
External protection fuse:	1 A type Gg or equivalent device

Technical data of control devices

Mechanical endurance:		
Spring-return button:	1 million operating cycles	
Emergency stop button:	50,000 operating cycles	
Selector switch:	300,000 operating cycles	
Key selector switch:	50,000 operating cycles	
	30,000 operating cycles including removal of the key	
Safety parameter B _{10D} :	130,000 (emergency stop button)	
Actuating force:		
Spring-return button:	min. 4 N	max. 100 N
Emergency stop button:	min. 20 N	max. 100 N
Selector switch:	min. 0.1 Nm	max. 1.5 Nm
Key selector switch:	min. 0.1 Nm	max. 1.3 Nm

Technical data of the contact blocks for standard spring return buttons, emergency stop buttons (2NC), selector switches and key selector switches

Material of the contacts:	silver contacts
Contact type:	Self-cleaning contacts with double interruption
Thermal current I _{th} :	1 A
Rated insulation voltage U _i :	32 Vac/dc
Rated impulse withstand voltage U _{imp} :	0.5 kV
Utilization category of the contact block:	DC13; U _e = 24 Vdc, I _e = 0.55 A
LED supply voltage:	24 Vdc ± 15%
LED supply current:	12 mA per LED

Technical data of contact blocks for emergency stop button (2NC + 1NO)

Material of the contacts:	gold-plated contacts
Contact type:	Self-cleaning contacts with double interruption
Thermal current I _{th} :	0.1 A
Rated insulation voltage U _i :	32 Vac/dc
Rated impulse withstand voltage U _{imp} :	0.5 kV
Utilization category of the contact block:	DC13; U _e = 24 Vdc, I _e = 0.1 A
LED supply voltage:	24 Vdc ± 15%
LED supply current:	12 mA

M12 connector electrical data

Max. operating voltage:	32 Vac/dc
Max. operating current:	max. 1.5 A

M23 connector electrical data

Max. operating voltage:	32 Vac/dc
Max. operating current:	Max. 3 A

In compliance with standards:

IEC 60947-5-1, IEC 60947-5-5, EN ISO 13850, UL 508, CSA C22.2 No. 14.

Compliance with the requirements of:

Machinery Directive 2006/42/EC, Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU, RoHS Directive 2011/65/EU.

⚠ Installation for safety applications:

Always connect the safety circuit to the NC contacts (normally closed contacts) as stated in standard EN 60947-5-1.

Actuation of the control devices from various directions

Thanks to the design with turnable modules, the control device units of the BN series offer the user many different options for fixing to the machine.

The orientation of the control devices can be selected independent of the fastening.

With the configurations for 6, 7 and 8 devices, the upper and lower part can be oriented independent of one another. This is especially useful if it should be possible to achieve a command state from two different sides of the machine. In these cases, a single device and single wiring harness can be used, thereby saving time and money.

General data

The new modular control device units of the BN series from Pizzato Elettrica can be combined perfectly with the RFID safety switches with lock of the NS series. Machine manufacturers who already use these products thereby have the possibility to attach a control device unit directly next to the safety switch that is identical in shape and dimensions.

The control device units of the BN series are available in configurations with 1 to 8 devices.

The unique design with individually turnable modules allows the user to select from a number of combinations. He receives a very versatile product that is immediately ready for use.

Compatibility with NS series switches

The control device units of the BN series have the same dimensions as the RFID safety switches with lock of the NS series. When mounted directly to the side of the switch, one obtains an integrated safety device whose components are made of the same material and have identical dimensions.

Minimal dimensions

One special feature of the control device units of the BN series is the slim thickness of just 40 mm.

The control devices are embedded in the housing of the unit and protrude only slightly out of the front.

This protects the control devices from unintended impacts, thereby increasing the service life of the devices and, at the same time, giving the devices an attractive design, making them predestined for use on modern machines in which this aspect is also given special consideration.

Turnable and non-detachable modules

During installation, the fixing modules can be turned on the top and bottom of the device to enable variable orientation of the control devices.

Operation is very simple: after loosening the fixing screws, the device body can be turned in steps of 90° and fixed in the desired position. Another advantage for the installer is that the fixing modules cannot be detached from the device body. Disassembly of the individual parts is not necessary and there is no risk of losing parts or reassembling incorrectly.

Protection against tampering

Each control device unit of the BN series is supplied complete with snap-on protection caps to be applied on the holes of the fixing screws. Not only do the caps prevent deposits of dirt from accumulating and simplify cleaning, they also prevent access to the fixing screws of the device, thereby offering increased protection against tampering.

Individually and freely configurable

The control device unit is available in various configurations: for standard applications there are configurations with 1 to 4 devices, while configurations with 6, 7 or 8 devices are available for more complex applications that allow a larger number of control and signalling devices to be attached at the same location for the user.

Removable and laser-markable lenses

With all product configurations, a number of devices can be installed that can also be illuminated via LEDs integrated in the device.

The buttons are equipped with removable lenses that can be laser-marked for a resistant, indelible engraving. This allows customization of the lenses with a wide range of text and symbols, and replacement with lenses of a different colour or with different markings. For a full list of available markings, see the Accessories chapter on page 375.

Protection guard for emergency stop button

The mushroom-shaped emergency stop button can be combined with a yellow protection guard that serves to protect the device from shocks. The protection guard can also be provided with a laser marking in accordance with EN ISO 13850.

Example: white lens for flush button with "O" engraving. VN NG-AC02-●●●● → VN NG-AC02-L1

How to replace lenses on buttons

The buttons in the BN series control device units feature replaceable lenses. When replacing the lens on a button, work must be performed with care to avoid irreversibly damaging the button. It is therefore recommended to carefully follow the sequence of steps described below for replacing the button lenses, and to avoid applying excessive force:

- 1 Locate one of the four slots on the lens.
- 2 Insert a small flathead screwdriver or cutter into one of the slots and gently pry off the old lens. Be careful not to scratch or damage the button during this step.
- 3 Position the new lens parallel to the button, using the reference notch on the button to align the lens correctly. For proper lens installation, make sure the reference notch faces upwards, as shown in the figure, or turn the lens in 90° steps with respect to the vertical axis. If the notch is not positioned correctly, the lens will not fit into the button and could be damaged.
- 4 Press down lightly and evenly on the lens until you hear a "click" confirming that the lens has snapped into place. Once properly installed, the lens should be perfectly horizontal and slightly raised — about 0.5 mm — above the edge of the button.

General data

The new modular control device units of Pizzato Elettrica's BN IO-Link series introduce IO-Link technology to the control device units of the BN series.

BN control device units with IO-Link technology enable accurate monitoring of all operating phases, immediate detection of any anomalies and quick and easy wiring thanks to plug & play technology.

The illuminated control device units of the BN series device with IO-Link, equipped with RGB LEDs, can be configured to emit the preferred colours with varying levels of light intensity, to blink at various frequencies or to fade out. The buttons are equipped with removable lenses that can be laser-marked for a resistant, indelible engraving. This allows customization of the lenses with a wide range of text and symbols, and replacement with lenses of a different colour or with different markings.

IO-Link

IO-Link is an open communication standard for sensors and actuators, defined by the PROFIBUS User Organization (PNO). IO-Link technology is a point-to-point communication standard that connects sensors and actuators to the control system. As well as the cyclic operating data of the connected sensors and actuators, parameter and diagnostic data is also sent.

Custom colour and RGB LEDs

The control devices of the BN series IO-Link control device unit can be illuminated, a solution to meet any requirements. As they have RGB LEDs, the buttons can be configured in a vast range of colours: red, green, blue, yellow, cyan, magenta and white. There are also 4 colours that can be configured by the user to customise the appearance of the control device unit to suit your own aesthetic and functional preferences. The brightness of the RGB LEDs can be adjusted via IO-Link to adapt to various environmental conditions, and the LEDs can also be set to blink at various frequencies and fade out.

Removable and laser-markable lenses

With all product configurations, a number of devices can be installed that can also be illuminated via LEDs integrated in the device.

The buttons are equipped with removable lenses that can be laser-marked for a resistant, indelible engraving. This allows customization of the lenses with a wide range of text and symbols, and replacement with lenses of a different colour or with different markings. For a full list of available markings, see the Accessories chapter on page 375.

Protection guard for emergency stop button

The mushroom-shaped emergency stop button can be combined with a yellow protection guard that serves to protect the device from shocks. The protection guard can also be provided with a laser marking in accordance with EN ISO 13850.

Data and configuration

The BN Series control device unit exchanges with the IO-Link master data on the surrounding environment, such as:

- State of the buttons (or the different types of devices);
- State of the LEDs;
- Supply voltage;
- Temperature;
- Device usage time.

The system detects any out-of-range values in the monitored data. Device data can be displayed in real time.

Plug & Play

The BN series IO-Link control device unit offers numerous advantages compared to traditional wired solutions. The Plug & Play technology makes the device easy to install without complex, time-consuming and costly wiring. This also means the device can be quickly replaced if it gets damaged or malfunctions, without having to dismantle whole parts of the plant.

Protection against tampering

Each control device unit of the BN series is supplied complete with snap-on protection caps to be applied on the holes of the fixing screws. Not only do the caps prevent deposits of dirt from accumulating and simplify cleaning, they also prevent access to the fixing screws of the device, thereby offering increased protection against tampering.

Machinery Directive 2006/42/EC, Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU, RoHS Directive 2011/65/EU.

Description

There's a new version of the Pizzato BN series control device unit that supports the modern IO-Link communication standard, opening the doors to new configuration, customisation and control options. The unit is quick and easy to update.

BN series IO-Link control device units can consist of one or two interconnected and rotatable modules: a distinctive feature of BN series control device units.

Each module can take 3 control devices (e.g. buttons, emergency stop buttons, selectors) so up to 6 devices can be installed in a single control device unit. The buttons have RGB LEDs, while the selector has a white LED.

Connection and power supply

The standard version of the BN series IO-Link control device unit comes with a 4-pole M12 connector for communicating with the IO-Link master. If an emergency stop button is installed, a second 4-pole M12 connector must be used for the relevant voltage-free contacts. The 4-pole M12 connector used to communicate with the IO-Link master has just 3 wires (positive and negative for the power supply, and the data connection). The supply voltage of the IO-Link master (24 VDC) also supplies power to the BN series control device unit. The cable can also be unscreened. It must have a max. length of 20 m.

Customisable LED mode

The state and colour of the RGB LEDs on the butt of the BN series IO-Link control device unit can be set to different modes, including:

1. Fixed light on;
2. Light blinking at 0.5 Hz;
3. Light blinking at 1 Hz;
4. Light blinking at 2 Hz;
5. Light fading out.

Night mode can also be set on the above types, dimming the brightness from "HIGH" to "LOW".

IO-Link control devices

The following types of control devices can be connected via IO-Link:

- White, spring-return button that can be illuminated with a RGB LED;
- Two- or three-position selector switch with handle that can be illuminated with a white LED.

Other control devices available on request, such as:

- White indicator light with RGB LED;
- Two-position key selector switch;
- Emergency stop button with push-pull release;
- Hole blanking plug.

Examples of available configurations

Lenses for VN NG-AC•• series buttons

Lenses without engraving			
Article	Description	Colours	Pieces/ package
VN NG-AC01	Lens for flush button, black, without engraving	●	10
VN NG-AC02	Lens for flush button, white, without engraving	○	10
VN NG-AC03	Lens for flush button, red, without engraving	●	10
VN NG-AC04	Lens for flush button, green, without engraving	●	10
VN NG-AC05	Lens for flush button, yellow, without engraving	●	10
VN NG-AC06	Lens for flush button, blue, without engraving	●	10
VN NG-ACA0	6 lenses for flush button without engraving, colours: black, white, red, green, yellow and blue	● ○ ● ● ● ●	1

Lenses with engraving			
Article	Description	Colours	Pieces/ package
VN NG-AC01-●●●●	Lens for flush button, black, with engraving	●	1
VN NG-AC02-●●●●	Lens for flush button, white, with engraving	○	1
VN NG-AC03-●●●●	Lens for flush button, red, with engraving	●	1
VN NG-AC04-●●●●	Lens for flush button, green, with engraving	●	1
VN NG-AC05-●●●●	Lens for flush button, yellow, with engraving	●	1
VN NG-AC06-●●●●	Lens for flush button, blue, with engraving	●	1

The black lens cannot be used with illuminated buttons.

For ordering lenses for buttons with marking: replace the dots ●●●● in the article codes with the marking code reported in the chapter Accessories on page 375. Example: white lens for flush button with "O" engraving. VN NG-AC02-●●●● → VN NG-AC02-L1

How to replace lenses on buttons

The buttons in the BN series control device units feature replaceable lenses. When replacing the lens on a button, work must be performed with care to avoid irreversibly damaging the button. It is therefore recommended to carefully follow the sequence of steps described below for replacing the button lenses, and to avoid applying excessive force:

- 1 Locate one of the four slots on the lens.
- 2 Insert a small flathead screwdriver or cutter into one of the slots and gently pry off the old lens. Be careful not to scratch or damage the button during this step.
- 3 Position the new lens parallel to the button, using the reference notch on the button to align the lens correctly. For proper lens installation, make sure the reference notch faces upwards, as shown in the figure, or turn the lens in 90° steps with respect to the vertical axis. If the notch is not positioned correctly, the lens will not fit into the button and could be damaged.
- 4 Press down lightly and evenly on the lens until you hear a "click" confirming that the lens has snapped into place. Once properly installed, the lens should be perfectly horizontal and slightly raised — about 0.5 mm — above the edge of the button.

[illegible][illegible]

[illegible]This image shows a full page of blank graph paper. The grid consists of small, equal-sized squares formed by thin, dark gray lines. There are 20 columns and 20 rows of squares, creating a total of 400 square units. The background is white, and the grid covers the entire area of the page.

Description

The P-Connect connection gateway is a system that allows up to six (6) devices to be connected to a data network. Safety information is exchanged via PROFIsafe, CIP Safety™ or Safety over EtherCAT® extensions. Depending on its configurations, the gateway can transmit signals from two NG or NS series RFID safety switches with lock. The connection is performed safely using PROFIsafe, CIP Safety™ or Safety over EtherCAT® standards. Furthermore, the P-Connect gateway can be connected to a number of devices available in the Pizzato Elettrica catalogue. These include the BN series modular control device units, and AN series handles with integrated signalling LED.

Positioning in safe areas

The P-Connect connection gateway can be positioned in safe areas, away from the connected devices, to limit the risk of accidental damage or tampering.

Various configurations available

The P-Connect connection gateway is available in various configurations for every kind of application. Depending on the configuration in fact it comes with various types of connectors to connect the devices to be monitored.

Series connection

P-Connect connection gateways have two connectors. One supplies electrical power to the device and the other is used for the connection to the fieldbus network. This means several P-Connect gateways can be connected in series by simply connecting together the input and output connectors. This notably reduces the time required for installing, uninstalling and replacing components during maintenance.

Connection to PROFINET/PROFIsafe, EtherNet/IP™/CIP Safety™ and EtherCAT®/Safety over EtherCAT® networks

The gateway is capable of connecting multiple Pizzato safety devices to a single PROFINET/PROFIsafe, EtherNet/IP™/CIP Safety™ or EtherCAT®/Safety over EtherCAT® network. This ensures easy installation, even on very large machinery, and minimises wiring. Additionally, PROFIsafe, CIP Safety™ and Safety over EtherCAT® functionalities enable the gateway to be used to transmit signals to the PLC regarding safety functions for applications up to SIL3/PLC/Cat. 4.

Field diagnostics

BP A1PL....

BP A1CL....

BP A1EL....

The P-Connect connection gateway has integrated signalling LEDs to give the user a quick field diagnostic overview.

BP A1PLxxx, BP A1CLxxx:

- System status LED: multicolour signalling LED, which by lighting, flashing and using different colours, indicates the various device operating states, as well as any warnings or system errors;
- Network status LED: state monitoring of the connected Ethernet network;
- Module status LED: signalling of diagnostic events regarding communication protocols;
- L/A LEDs: two Link/Activity LEDs, corresponding to the two Ethernet ports on the device, signalling the status and connection speed.

BP A1ELxxx:

- "SYSTEM STATE": multicolour signal, which through sequences of lighting, flashing and colour changes, indicates the various operating states of the device to the user, as well as any warnings or errors concerning internal electronic components;
- "L/A EC IN/OUT": Two "Link/Activity" LEDs, corresponding to the two EtherCAT® ports on the device, signalling the status and connection speed;
- "RUN": indicates the status and operation of the EtherCAT® network;
- "ERROR": indicates EtherCAT® communication errors.

Diagnostic data

The P-Connect connection gateway allows quick access to diagnostic data such as internal temperature, gateway supply voltage, or current consumption of the connected devices. This makes it easy to monitor the gateway and the connected devices, quickly detecting any malfunctions.

Plug&Play device

With connectors on both the power side and the device side, the P-Connect connection gateway is a Plug&Play solution that saves installation time compared to traditional solutions that must be wired into a cabinet. What's more, it can quickly be replaced if there's a malfunction or if it gets damaged.

Power supply electrical data

Rated voltage (U_n): 24 Vdc SELV/PELV
 Supply voltage tolerance: ±15%
 Operating current at U_n voltage:
 - no devices connected: 0.1 A
 - maximum supported current: 3.1 A
 Insulation voltage U_i : 32 V
 Shock and vibration resistance: acc. to EN 60947-1
 EMC protection: acc. to EN 61000-4 and EN 61326-3-1
 External protection fuse: 4A type gG for a single BP gateway;
 for series connection the total load must be calculated.

Input and output circuits

Number of safety inputs: 3 dual-channel
 Number of safety outputs: 1 dual channel
 (or 2 single channel)
 Number of non-safety inputs: 14
 Number of non-safety outputs: 24
 Number of test outputs: 2
 Maximum voltage at non-safety inputs: 24 Vdc
 Voltage at non-safety outputs: 24 Vdc
 Maximum control current at non-safety outputs: 50 mA
 Maximum current at test outputs: 100 mA
 Maximum current at safe outputs: 250 mA

In compliance with standards:

EN 60947-1, EN 61326-1, EN 61326-3-1, UL 508, CSA C22.2 No. 14, EN IEC 63000, EN 60529, IEC 61784-3-3, EN 61508, EN IEC 62061, EN ISO 13849-1, EN 61131-2.

Compliance with the requirements of:

Machinery Directive 2006/42/EC, EMC Directive 2014/30/EU, RoHS Directive 2011/65/EU.

Setting/changing IP addresses

PROFINET/PROFIsafe networks

The PROFIsafe F - Address identifies the device on the PROFIsafe network with a unique ID, protecting standard address mechanisms such as IP addresses. The safety address (F - Address) must be set using the 8 DIP switches located under the cover of the P-Connect gateway, labelled "ADDRESS". This value can be set from 1 to 255 and must be unique for every device connected to the network. Restart the device after setting the F - Address. Switches SW1 and SW2 are not used in this application.

EtherNet/IP™/CIP Safety™ networks

The housing contains 8 "ADDRESS" DIP switches that can be modified by the user and enable selection of one of the following modes:

- IP can be freely modified using Logix Designer (if all DIP switches are set to ON);
- IP fixed and set via hardware.

These 8 DIP switches represent the binary equivalent of the last octet of the IP address. The remainder (the first 3 groups of eight) is fixed to 192.168.1.xxx. You can therefore set a value between 1 and 254 (255 activates the change via software) taking care that the address is not already in use by other devices on the network. Restart the device after setting the F - Address. Switches SW1 and SW2 are not used in this application.

EtherCAT®/Safety over EtherCAT® networks

The safe address (FSoE Address) provides a unique identification of the device on the EtherCAT® network. The safe FSoE Address in TwinCAT 3 is set in the Safety logic tab and it must correspond to the physical address set by means of two DIP switches within the BP housing. The FSoE Address can be set from 1 to 255 and must be unique for each network device (The factory default address is set to 1). After setting the safe address, the device must be restarted. Switches SW1 and SW2 are not used in this application.

Emergency stop buttons

Some of the P-Connect gateway configurations can be used to manage up to two series of emergency stop buttons connected internally in series to the gateway. If you are not going to use both series of emergency stop buttons, bypass one of them using the "DIP3" switch (called "E-STOP BYPASS") located under the cover of the P-Connect gateway. If switches "1" and "2" are set to the "ON" position, the first series of connected emergency stop buttons is bypassed; while switches "4" and "5" activate the bypass for the second series of connected emergency stop buttons. The switches must only be switched when the P-Connect gateway is OFF, to prevent incoherent input test signal readings.

OSx = Safety outputs

I3 = Actuator programming input/reset

I5 = EDM input (cannot be used on BP series)

I = Device input

O = Device output

Description

The new BC series passive distribution box from Pizzato can be used to connect safety devices with 8-pole M12 male connector in series. This makes it possible to group various input/output signals in one single 19-pole or 12-pole connection or with an M23 connector, which is then connected to the control device. Grouping the connections in a single box makes wiring faster and tidier, thereby avoiding the need to lay multiple lines. In addition, it's easier to replace devices if needed. This solution improves power distribution compared to the typical series connection, so more NG/NS series devices can be connected. The BC series distribution box is provided with a strong, compact, sealed housing. It's waterproof and withstands vibrations or shock, and has a diagnostics' LED that shows the state of the connected device.

Main features

Code structure

BC 1Z4A1A1FSK

Design and material of the housing

1	Technopolymer housing 54 x 115 mm
2	Technopolymer housing 54 x 152 mm

Type and number of inputs

4A	4 inputs, M12 female connector, 8-pole
8A	8 inputs, M12 female connector, 8-pole

Type of distribution of the input signals on the devices

1	One common input I3/IE1 for all devices (for versions with 4 or 8 device connections)
2	Independently connected inputs I3/IE1 (only for version with 4 device connections)
3	Independently connected inputs I3/IE1 for 6 devices and one common input for two additional devices (only for version with 8 device connections)

Connection type

K	Integrated connectors
2	Cable length: 2 m
5	Cable length: 5 m
10	Cable length: 10 m

Direction of the output connection and cable or connector type

FS	Front output, M23 connector, 12-pole (for BC ●●4A●●●●● versions only)
FT	Front output, M23 connector, 19-pole (for BC ●●8A●●●●● versions only)
AF	Axial output, PVC cable, 12 x 0.5 mm ² (for BC ●●4A●●●●● versions only)
AL	Axial output, PVC cable, 2 x 0.75 mm ² + 17 x 0.34 mm ² (for BC ●●8A●●●●● versions only)

Connection example for the devices

Note: Outputs O3/O4 indicate the "Guard closed" state (O3) for the devices of the ST and HX series, while they indicate the "Guard closed and locked" state (O4) for the devices of the NS and NG series.

Note: A VF CY104P0 bridge connector must be connected on all M12 connectors that are not connected to a device.

Main features

- Technopolymer housing
- Protection degree up to IP67
- Various models available for I/O: M23 connector, 19-pole cable, 12-pole cable
- Versions with 4 or 8 M12 connectors available
- Integrated signalling LEDs

Quality marks:

Technical data

Housing

Housing made of glass fibre reinforced technopolymer, self-extinguishing and shock-proof
Protection degree: IP65 acc. to EN 60529
IP67 acc. to EN 60529

General data

Ambient temperature: -20°C ... +50°C
Storage temperature: -40°C ... +75°C
Tightening torque, body: 2 ... 3Nm
Tightening torque, M12 connectors: 0.6 ... 0.8 Nm
Tightening torque, M23 connectors: 1 ... 1.5 Nm

General electrical data

Rated operating voltage U_o : 24 Vdc
Rated insulation voltage U_i : 30 Vac / 36 Vdc
External protection fuse: 8 A type gG for connection A1
Maximum operating current M12 connector, 8-pole: 2 A

Electrical data of distribution box with 4 M12 connectors

Maximum operating current with 12-pole cable: 5 A x 0.5 mm² (20 AWG), the currents are per conductor
Maximum operating current M23 connector, 12-pole: 8 A pin 6 and pin 19, 4 A all other pins, currents apply per pin

Electrical data of distribution box with 8 M12 connectors

Maximum operating current with 19-pole cable: 8 A x 0.75 mm² (19 AWG) pink cable, white-pink cable
4 A x 0.34 mm² (22 AWG) all other cables
Maximum operating current M23 connector, 19-pole: 8 A pin 6 and pin 19, 4 A for all other pins

In compliance with standards:

EN 60947-1, EN 60529, EN 61000-6-2, EN 61000-6-3, EN IEC 63000.

Compliance with the requirements of:

RoHS Directive 2011/65/EU.

Accessories

Male bridge connector, M12

Features:

- M12 male connector without cable, with internal jumpers for plugging into the unused M12 sockets of the distribution box.
- Polyurethane connector body
- Gold-plated contacts
- Anti-vibration self-locking ring nut

Max. operating voltage: 250 Vac / 300 Vdc
Max. operating current: 2 A
Protection degree: IP67 acc. to EN 60529
Tightening torque of the ring: 0.6 ... 0.8 Nm

M12 male connectors with cable

Features:

- Polyurethane connector body
- Class 6 copper conductors acc. to IEC 60228 - mobile installation
- Gold-plated contacts
- Anti-vibration self-locking ring nut
- High flexibility cable with oil resistant PVC or PUR sheath suitable to be used in drag chains, acc. to IEC 60332-1-2

Max. operating voltage:	250 Vac / 300 Vdc (4/5-pole) 30 Vac / 36 Vdc (8/12-pole)
Max. operating current:	4 A (4-5-pole); 2 A (8-pole); 1.5 A (12-pole)
Protection degree:	IP67 acc. to EN 60529, IP69K acc. to ISO 20653 (Protect the cables from direct high-pressure and high-temperature jets)
Ambient temperature:	-25°C ... +80°C, PVC sheath, fixed installation -15°C ... +80°C, PVC sheath, mobile installation -40°C ... +80°C, PUR sheath, fixed installation -25°C ... +80°C, PUR sheath, mobile installation
Wire cross-sections:	0.34 mm ² (22 AWG) for 4-pole 0.25 mm ² (23 AWG) for 5/8-pole 0.14 mm ² (26 AWG) for 12-pole
Minimum bending radius:	> cable diameter x 15
Tightening torque of the ring:	0.6 ... 0.8 Nm

ATTENTION: always disconnect the power supply before removing the connector. The connector is not suitable for separation of electrical loads.

Series connection with Y-shaped M12 connectors

To facilitate and simplify the series wiring of the safety devices, a variety of accessories designed specifically for this purpose are available. With the help of the proven M12 round connector, safety equipment of Category 4, SIL 3 and PL e with up to 32 elements connected in series is possible. All of which is possible without the risk of connection errors and with a high IP67 protection degree.

The safety circuits consist of a 24 Vdc power supply unit, a number of extensions to the installed devices, Y connectors for branching out from the chain to each individual device and a terminating plug.

In addition to the power supply unit, a suitable safety module is used to assess the state of the safety outputs within the safety chain.

Devices suitable for series connection

The series may consist both of devices that are identical to one another (homogeneous series) or that belong to different series (mixed series).

The following Pizzato Elettrica devices may be connected in series using the Y connectors:

- ST series RFID safety sensors: ST ••31•M•, ST ••71•M•.
- NG series RFID safety switches with lock: NG •••••••-K950, NG •••••••-K951, NG •••••••-K952.
- NS series RFID safety switches with lock: NS •••••••Q•.
- HX series safety hinge switches: HX BEE1••M.

Electrical connection of the chain

Pin	Colour	Connection
1	Brown	A1 Supply input +24 Vdc
2	White	OS1 Safety output
3	Blue	A2 Supply input 0 V
4	Black	OS2 Safety output
5	Grey	I4 Solenoid activation input

Note: By activating/deactivating input I4, all switches of the NG and NS series in the chain simultaneously block/open all guards. Activation and deactivation of input I4 has no effect on the ST sensors and HX hinges in the chain.

Attention! For proper operation of the devices connected in series via cables or Y connectors, it is necessary to pay particular attention to the voltage drop that occurs in the circuit. Pay particular attention to the currents and cross-sections/lengths of the used cables to ensure that the supply voltage of the components at the end of the series connection remains within the specified limit values during effective operation.

M12 extension cables with male and female connector

Features:

- Polyurethane connector body
- Class 6 copper conductors acc. to IEC 60228
- Gold-plated contacts
- Anti-vibration self-locking ring nut

M12 connectors, Y-shaped, for series connections

Article	Description
VF CY201P0	Y-cable with M12 connectors, for series connections, 150 mm cable length

Article	Description
VF CY203P0	M12 connector, Y-shaped, for series connections without cable

Features:

- Polyurethane connector body
- Gold-plated contacts
- Anti-vibration self-locking ring nut
- Class 6 copper conductors acc. to IEC 60228
- High flexibility cable with oil resistant PVC sheath suitable to be used in drag chains, acc. to IEC 60332-1-2

Max. operating voltage: 30 Vac / 36 Vdc

Max. operating current: 4 A (5-pole)

Protection degree: IP67 acc. to EN 60529

Ambient temperature: -25°C ... +80°C for fixed installation
-15°C ... +80°C for mobile installation

Wire cross-sections: 0.5 mm² (20 AWG)

Minimum bending radius: $> \text{cable diameter} \times 15$

Tightening torque of the ring: 0.6 ... 0.8 Nm

Internal wiring diagram, Y-shaped connector

Pin assignment

(A) M12, 5-pole female

(B) M12, 5-pole male

(C) M12, 8-pole female

IMPORTANT: When used in safety applications, the Y connectors must be installed in a location that is not directly accessible, so as to avoid shocks or tampering.

M12 terminating plugs for series connections

Features:

- Polyurethane connector body
- Gold-plated contacts
- Anti-vibration self-locking ring nut

Max. operating voltage:

250 Vac / 300 Vdc

Max. operating current:

4 A

Protection degree:

IP67 acc. to EN 60529

Tightening torque of the ring:

0.6 ... 0.8 Nm

Internal wiring diagram of the terminating plug

Pin assignment

M23 male connectors for panel mounting

Features:

- Threaded connection M20 for installation on switches with M20 cable entry (for example: FG series and NG series)
- Nickel-plated metal connector body
- Gold-plated contacts
- 12-pole or 19-pole versions
- Wires with pre-insulated ferrules
- Directly installable on the device, these ensure quick replacement, reducing machine down time

Max. operating voltage:	250 Vac (12-pole) 100 Vac (19-pole)
Max. operating current:	3 A
Protection degree:	IP67 acc. to EN 60529 IP69K acc. to ISO 20653
Ambient temperature:	-25°C ... +80°C
Tightening torque:	1 ... 1.5 Nm
Wire cross-section:	0.34 mm ² (22 AWG)
Contact type:	gold-plated

Door holding magnets

Article	Description
SM H9ZF	Door holding magnet (holding force 40 N)
SM H9ZQ	Door holding magnet (holding force 40 N, opposite polarity to SM H9ZF)

Holding magnets for use on machinery doors. The magnets are contained inside a sealed plastic cover and will not rust even in damp environments.

Tamper-protection systems

Coded screw covers for switches and actuators

Features:

Coded screw covers are fitted via snap-on application to the openings of the fixing screws, making it impossible to access the screws and therefore disassemble the switch or actuator. The shells can only be removed by breaking them. Thus, any attempt to tamper with them will be immediately evident.

By recording the data of the protective covers during final installation of the machine, e.g., by photographing the installed products, any replacements can be detected subsequently.

These new, coded protective covers can, therefore, also be used as a replacement for standard covers (should they be lost) without affecting the protection against tampering.

The covers are available for series SR, SM A, ST G, ST D, ST H, SM G, SM H, SM D, SM L, SM E, AN, NG (actuator), NS (housing), NS (actuator), NX.

Article	Description	Packs of 10 pcs.

VF PC11A9	Coded protective screw covers for series ST D - ST H - SM G - SM H - SM D - SM L - SM E	
VF PC12A9	Coded protective screw covers for the NG series (actuator)	
VF PC13A9	Coded protective screw covers for the NS series (housing) - AN	
VF PC14A9	Coded protective screw covers for the NS series (actuator)	

Coded covers for M12 connectors

Features:

These coded protective covers consists of two identical half shells that are snapped onto the M12 connectors of the safety devices and make it impossible to detach the connector. The shells can only be removed by breaking them. Thus, any attempt to tamper with them will be immediately evident. The coding has the same properties as the screw covers described above, thereby guaranteeing tens of thousands of different combinations.

The protective covers are suitable for all devices with an M12 connector (e.g., NX, NS, ST, SR series) but they can also be used for junctions between male and female M12 connectors.

A version made of blue detectable technopolymer is available for the food industry, and it can easily be detected during the process using common optical vision technologies, X-rays or metal detectors.

Installation:

Article	Description	Packs of 10 pcs.	Colour / material
VF PC21A9	Coded protective covers for M12 connectors integrated in the device		● Grey technopolymer
VF PC22A9	Coded protective covers for M12 extension cables		● Grey technopolymer
VF PC21B6	Coded protective covers for M12 connectors integrated in the device		● Blue detectable technopolymer
VF PC22B6	Coded protective covers for M12 extension cables		● Blue detectable technopolymer

LED signalling lights

Packs of **5 pcs.**

These signalling lights with high luminosity LEDs are used for signalling that an electric contact has changed its state inside the switch. They can be installed on switches of the FL, FX, FW, FG, FY, NG or FS series by screwing them on one of the conduit entries not used for electric cables. They can be used for many different purposes: for example, to signal, from a distance, whether the switch has been actuated; whether the guard has closed correctly; or whether the guard is locked or unlocked.

The inner part can rotate in such a way that it can be wired and screwed on the switch without any risk of twisting the wires.

Features:

Protection degree:

IP67 acc. to EN 60529

Ambient temperature:

IP69K acc. to ISO 20653

Operating voltage U_n :

-25°C ... +70°C

24 Vac/dc (10 mA)

120 Vac (20 mA)

230 Vac (20 mA)

Tolerance on the supply voltages:

 $\pm 15\%$ of U_n

Operating current:

10 mA

Connection system:

PUSH-IN spring type

Cross-section of rigid/flexible wires w. wire-end sleeve:

min. 1 x 0.34 mm² (1 x AWG 24)max. 1 x 1.5 mm² (1 x AWG 16)

Wire cross-section with pre-insulated wire-end sleeve:

min. 1 x 0.34 mm² (1 x AWG 24)max. 1 x 0.75 mm² (1 x AWG 18)

Tightening torque:

1.2 ... 2 Nm

Wire stripping length (x):

min.: 8 mm

max.: 12 mm

Junction box for series connection of up to 4 devices

This accessory allows easy and precise series connection of up to 4 devices. Thanks to the numbered terminals and to the internal circuit, it is sufficient to connect the conductors in the slots provided with the practical and fast PUSH-IN spring connections.

Thanks to the four internal microswitches, it is possible to easily and immediately direct the device signalling outputs (open or closed, locked or unlocked) to one of the four available auxiliary channels and then manage the information independently for each channel through a PLC.

Features:

Material:

Self-extinguishing shock-proof polycarbonate with double insulation, UV-resistant and glass fibre reinforced

Material of the screws:

Stainless steel

Protection degree:

IP67 acc. to EN 60529, IP69K acc. to ISO 20653, with cable gland of equal or higher protection degree

Conduit entries:

2x M20 - 1/2 NPT knock-out side entries
2x M20 - 1/2 NPT - M25 knock-out side entries
2x M16 knock-out base entries

Ambient temperature:

-40°C ... +80°C

[illegible][illegible]

Installation of single switches with safety functions

- Use **only** switches with the symbol  (see figure on the side).
- Connect the safety circuit to **the NC normally closed contacts (11-12, 21-22 or 31-32)**.
- **The NO normally open contacts (13-14, 23-24, 33-34)** should be used **only for signalling**; these contacts are not to be connected with the safety circuit. However, if two or more switches are used on the same guard, a connection can be established between the NO contacts and the safety circuit. In this case at least one of the two switches must have positive opening and a normally closed contact NC (11-12, 21-22 or 31-32) must be connected to the safety circuit.
- Actuate the switch **at least up to the positive opening travel** shown in the travel diagrams with symbol .
- The actuation system must be able to exert a force that is greater than the **positive opening force**, as specified in brackets below each article, next to the minimum force value.
- The device must be affixed in compliance with EN ISO 14119.

Whenever the machine guard is opened and during the whole opening travel, **the switch must be pressed directly** (fig. 1) **or through a rigid connection** (fig. 2).

Only in this way the positive opening of the normally closed NC contacts (11-12, 21-22, 31-32) is guaranteed.

Fig.1

Fig.2

In safety applications with only one switch for each guard, the switches **must never be activated by a release** (fig. 3 and 4) **or through a non rigid connection** (i.e. by a spring).

Fig.3

Fig.4

Mechanical stop

Acc. to EN ISO 14119 paragraph 5.2 letter h) the position sensors must not be used as mechanical stop.

Actuation modes

Recommended application	Application to avoid This application is possible, but increased mechanical stress may shorten the operating life of the switch	Forbidden application

Switches for heavy duty applications

Maximum and minimum actuation speed - FD, FL, FP, FC series

Roller lever - Type 1

General requirements

The device is designed to be installed on industrial machineries. The installation must be performed only by qualified staff aware of the regulations in force in the Country of installation. The device must be used exactly as supplied, properly fixed to the machine and wired.

It is not allowed to disassemble the product and use only parts of the same, the device is designed to be used in its assembly as supplied. It is prohibited to modify the device, even slightly e.g.: replace parts of it, drill it, lubricate it, clean it with gasoline or gas oil or any aggressive chemical agents.

The protection degree of the device refers to the electrical contacts only. Carefully evaluate all the polluting agents present in the application before installing the device, since the IP protection degree refers exclusively to agents such as dust and water according to EN 60529. Thus the device may not be suitable for installation in environments with dust in high quantity, condensation, humidity, steam, corrosive and chemical agents, flammable or explosive gas, flammable or explosive dust or other polluting agents.

Some devices are provided with a housing with openings for connecting the electrical cables. To guarantee an adequate protection degree of the device, the opening that the wiring passes through must be protected against the penetration of harmful materials by means of an appropriate seal. Proper wiring therefore requires the use of cable glands, connectors or other devices with IP protection degree that is equal to or greater than that of the device.

Store the products in their original packaging, in a dry place with temperature between -40° C and +70°C

Failure to comply with these requirements or incorrect use during operation can lead to the damage of the device and the loss of the function performed by the device itself. This will result in termination of the warranty on the item and will release the manufacturer from any liability.

Using the devices

- Before use, check if the national rules provide for further requirements in addition to those given here.
- Before installation, make sure the device is not damaged in any part.
- All devices are designed for actuation by moving parts of industrial machines.
- Do not use the device as a mechanical stop of the actuator.
- Do not apply excessive force to the device once it has reached the end of its actuation travel.
- Do not exceed the maximum actuation travel.
- Avoid contact of the device with corrosive fluids.
- Do not stress the device with bending or torsion.
- Do not disassemble or try to repair the device, in case of defect or fault replace the entire device.
- In case the device is deformed or damaged it must be entirely replaced. Correct operation cannot be guaranteed if the device is deformed or damaged.
- Always attach the following instructions to the manual of the machine in which the device is installed.
- If specific operating instructions exist for a device (supplied or downloadable from www.pizzato.com), they must always be included with the machine manual and be available for the entire service life of the machine.
- These operating instructions must be kept available for consultation at any time and for the whole period of use of the device.

Wiring and installation

- Installation must be carried out by qualified staff only.
- Use of the device is limited to function as a control switch.
- Observe minimum distances between devices (if provided).
- Comply with the tightening torques indicated in this catalogue.
- Keep the electrical load below the value specified by the respective utilization category.
- Disconnect the power before to work on the contacts, also during the wiring.
- Do not paint or varnish the devices.
- Install the product on flat and clean surfaces only.
- Do not bend or deform the device during installation.
- Never use the device as support for other machine components (cable ducts, tubes, etc.)
- For installation on the machine, use the intended bore holes in the housing. The device must be fixed with screws of adequate length and resistance to the expected stress. At least two screws (fitted to holes most suitable for the intended use) are required to fix the housing to the machine.
- After and during installation, do not pull the electrical cables connected to the device. If excessive tension is applied to the cables (that is not supported by an appropriate cable gland), the contact block of the device may be damaged.
- Provided that the device has an electrical connector, always switch off the circuit voltage before disconnecting the connector from the switch. The connector is not suitable for separation of electrical loads.
- During wiring comply with the following requirements:
 - for terminals (if present), comply with the minimum and maximum cross-sections of the conductors;
 - tighten the electrical terminals (if present) with the torque indicated in this catalogue;
 - do not introduce polluting agents into the device as: talc, lubricants for cable sliding, powder separating agents for multipolar cables, small strands of copper and other pollutants that could affect the proper functioning of the device;
 - before closing the device cover (if present), check that the sealing gaskets and the contact unit are correctly positioned and properly seated in their respective slots;
 - verify that the electrical cables, wire-end sleeves, cable numbering systems and any other parts do not obstruct the cover from closing correctly or if pressed between them do not damage or compress the internal contact block;
 - for devices with integrated cable, the free end of the cable must be properly connected inside a protected housing. The electrical cable must be properly protected from cuts, impacts, abrasion, etc.
- After installation and before commissioning of the machine, verify:
 - the correct operation of the device and all its parts;
 - the correct wiring and tightening of all screws;
 - the actuating travel of the actuator must be shorter than the maximum travel allowed by the device.
- After installation, periodically check for correct device operation.

Do not use in following environments:

- Environments where dust and dirt can cover the device and by sedimentation stop its correct working.
- Environment where continuous temperature fluctuations cause the formation of condensation.

- Environments where coatings of ice may form on the device.
- Environments where the application causes knocks or vibrations that could damage the device.
- Environment with presence of explosive or flammable gas or dust. The current limit does not apply to devices declared compliant with directive ATEX 2014/34/EU.
- Prior to installation, the installer must ensure that the device is suitable for use under the ambient conditions on site.

B=February, etc.) The second and third letters refer to the year of manufacture (25 = 2025, 26 = 2026, etc...)

Limits of use

- Use the devices following the instructions, complying with their operation limits and the standards in force.
- Do not use in the presence of artificial radioactivity.
- Do not use in vacuum or high-pressure environments.
- The devices have specific application limits (min. and max. ambient temperature, mechanical endurance, protection degree, utilisation category, etc.) These limits are met by the different devices only if considered individually and not if combined with each other. For further information contact our technical department.
- The utilization implies knowledge of and compliance with following standards: EN 60204-1, EN 60947-5-1, ISO 12100, EN ISO 14119.
- Please contact our technical department for information and assistance (phone +39.0424.470.930 – e-mail tech@pizzato.com) in the following cases:
- cases not mentioned in the present utilization requirements.
- in nuclear power stations, trains, airplanes, cars, incinerators, medical devices or any application where the safety of two or more persons depend on the correct operation of the device.

Additional requirements for safety applications

- Provided that all previous requirements for the devices are fulfilled, for installations with operator protection function additional requirements must be observed.
- The utilization implies knowledge of and compliance with following standards: IEC 60204-1, IEC 60947-5-1, ISO 12100, EN ISO 14119, EN IEC 62061, EN ISO 13849-1, EN ISO 13850.
- The protection fuse (or equivalent device) must be always connected in series with the NC contacts of the safety circuit.
- Periodically verify the correct working of the safety devices; the periodicity of this verification is settled by the machine manufacturer based on the machine danger degree and it does not have to be less than one a year.
- After installation and before commissioning of the machine, verify:
 - the correct operation of the device and all its parts;
 - the correct wiring and tightening of all screws;
 - the actuating travel of the actuator must be shorter than the maximum travel allowed by the device;
 - the actuating travel of the actuator must be greater than the positive opening travel;
 - the actuation system must be able to exert a force that is greater than the positive opening force.
- Devices with a safety function have a limited service life. Although still functioning, after 20 years from the date of manufacture the device must be replaced completely.
- The production date can be derived from the production batch on the item. Example: A23 FD7-411. The batch's first letter refers to the month of manufacture (A=January,

Features

The contact blocks developed by Pizzato Elettrica are the result of more than 30 years of development experience and millions of sold switches. The range of available contact blocks is one of the most extensive in the world in the sector of position switches.

This chapter introduces to some features of Pizzato Elettrica contact blocks, in order to give the final user a better understanding of the technologies behind that element simply named "contact".

We underline that contact blocks are not available for sale (to the public) separately from switches, both because some of them are mechanically connected to the switch and because some technical features may change in accordance with the switch and its function. The following data is only intended to serve as an aid for the initial selection of the contact block. It is not to be used for determining the characteristics of the switch that uses this contact block. For example, the use of a contact block with positive opening with a switch with flexible actuator results in the combination of the two devices not having positive opening.

In this chapter, the properties of the E1 electronic contact block are explained in detail. It is used with position switches with multiple monitoring tasks that would require extensive effort to realize with electronic sensors. There is no other electronic sensor on the market that can match this contact unit with respect to precision and repeatability, adjustment of the switching point, operating temperature and price.

Description

- 1** Captive screws
- 2** Finger protection
- 3** Clamping screw plates for cables with various diameters
- 4** Self-lifting clamping screw plates
- 5** Material of the contacts: Silver alloy or gold-plated silver alloy
- 6** Contact technology and reliability: Single bridge, double bridge
- 7** Operating voltages and currents for reliable switching

Description

- 8** Classification of the contact type acc. to EN 60947-5-1: X, Y, C, Za, Zb
- 9** Contact type: Slow action / snap action / snap action with constant pressure
- 10** Force on contacts
- 11** Positive opening of contacts

1 Captive screws

Switches with this characteristic have clamping screws that remain in place even if completely unscrewed. This feature reduces wiring time, since the operator does not have to be careful not to unscrew the screws completely and does not risk to lose them by mistake, which is very useful in case of wirings in uncomfortable position.

2 Finger protection

All terminals in the contact blocks have protection degree IP20 in accordance with EN 60529, they are therefore protected against access to dangerous parts with a diameter greater than 12 mm.

3 Clamping screw plates for cables with various diameters

The clamping screw plates are provided with a particular "roofing tile" structure and are loosely coupled to the clamping screw. The design causes connection wires of different diameter to be pulled towards the screw when tightening the screw (see figure), preventing the wires from escaping towards the outside.

4 Self-lifting clamping screw plates

Switches with this feature are equipped with clamping screw plates that move up or down by turning the clamping screw; wiring is easier and faster as a result.

5 Material of the contacts: gold-plated silver alloy

The contact blocks can be supplied with silver electric contacts with a special gold-plated surface, with total gold thickness of one micron. This type of treatment can be useful in environments which are aggressive against silver (very humid or sulphurous atmospheres) and in case of very small electric loads, usually with low voltages and supply currents. This thickness of the gold coating permits several million switching cycles.

6 Contact technology and reliability

Very rarely, an electric contact does not function. A failed switching operation is a typical consequence of an exceptionally high contact resistance caused by dust, a thin layer of oxidation or other impurities that could penetrate the switch during wiring. Thus, the repeated occurrence of faulty switching depends not only on the sensor type, but also on its environmental conditions and the load that the switch drives. These effects are more evident with low electrical loads if the electric voltage cannot penetrate the thin layers of oxide or small grains of dust.

This type of malfunction can normally be tolerated with hand-operated devices, because repeating the operation is enough to restore the function. This is not the case with position switches, as severe machine damage could result if the end position is not ascertained.

In the following table we refer to two typical contact structures (type A and B) normally used in the industry and the ones which have been used by Pizzato Elettrica for several years in most switches: movable contacts with double interruption and twin bridge (type C).

As you can see from the table below, the last structure (type C) has the same contact resistance (**R**) as the simple mobile contact (type A), but with a lower failure probability (**fe**).

With a failure probability of **x** for a single switching operation, the failure probability for type A is **fe=x**, for type B **fe=2·x**, whereas for type C it is **fe=4·x²**.

This means that if the probability of a switching failure is x in a given situation, e.g., 1x10⁻⁴, (1 switching failure in 10,000), the result is as follows:

- for type A one failed commutation every 10,000.
- for type B one failed commutation every 5,000.
- for type C one failed commutation every 25,000,000.

Type	Diagram	Description	Contact resistance R	Probability of errors fe
A		simple mobile contact	$R=R_c$	$fe=x$
B		mobile contact with double interruption	$R=2 \cdot R_c$	$fe=2x \cdot x^2$
C		mobile contact with double interruption and twin bridge	$R= \frac{2 \cdot R_c}{2} = R_c$	$fe=4x^2-4x^3+x^4$

7 Minimum operating voltages and currents for reliable switching

The reliability of an electric contact depends on several factors, whose influence varies depending on the type of load. For high power loads is necessary for the contact to be able to dissipate the heat generated during switching. For low power loads, instead, it is important that it oxides and other impurities do not obstruct the passing of the electric signal. As a result, the material chosen for the electric contacts is a compromise among different and sometimes contrasting needs. In position switches contacts are usually made of a silver that has proved to be suitable for the switching of loads in the range of approximately 1 kW to 0.1 W. However, at lower loads, the effects of the oxide, which silver naturally develops upon contact with air, may occur; additionally to be taken into account are possible contaminations or impurities in the contact switching chamber (for example the talc powder in the cable sheaths that an installer could accidentally insert in the switch may have a similar effect).

It is impossible to define a fix threshold above which the “missing switching phenomenon” does not appear, because there are a lot of mechanical and electric parameters that influence this value. For example, in laboratory environment a good twin bridge electric contact is able to switch loads in the μW range for dozens of millions of handling operations, without losing signals. However, this does not mean that the same contact will have the same performance when the switch operates in environments with sudden changes of temperature (condensation) or where few switching occur (oxidation).

In order to avoid this kind of problem, gold plated contacts are used for very low loads profiting from the non-oxidability of this material. The gold-plating layer should be thick enough to be mechanically resistant to switching as well as electrically resistant to possible sparks that may vaporize it. For this reason Pizzato Elettrica uses micron thickness gold plating suitable for millions of working cycles. Thinner gold plating layers have often a purely aesthetic function and are only suitable to protect the product against oxidation during long time storage.

The minimum current and voltage values recommended by Pizzato Elettrica are shown in the diagram below, that is divided into two areas defined by a steady power limit. These values identify voltage and current combinations with high commutation reliability in most industrial fields. The lower voltage and current limits shown in the diagram are typical minimum values for industrial applications. They may also be reduced in non typical conditions. It is recommended, however, to always evaluate that the signal power to be switched is at least one magnitude order higher than the noise produced in the electric circuit, in particular when circuit cables are long and pass through areas with high electromagnetic fields and especially for powers lower than 10 mW.

100 mW Recommended limit for general applications with snap action contact blocks with silver alloy contacts.

200 mW Recommended limit for general applications with slow action contact blocks with silver alloy contacts.

8 Classification of the contact block acc. to the EN 60947-5-1

Design	Figure	Symbol	Description
X			Double interruption contact element with two terminals
Y			
C			Change-over contact element with single interruption and three terminals
Za			Change-over contact element with double interruption and four terminals. The contacts have identical polarity
Zb			Change-over contact element with double interruption and four terminals. Mobile contacts are electrically separated

Electrically separated contacts

The “+” symbol between two designs (e.g., X+X, Za+Za, X+X+Y, etc.) represents the combination of simple, **electrically separated** contact blocks.

The electrically separated contacts allow different voltages to be applied between the contacts and loads to be connected to different polarities (figure 1).

Requirements and restrictions for Za contacts

Electrical loads must be connected to the same phase or polarity. The contacts **are not** electrically separated. As a result, different voltages may not be applied to the NC and NO contacts (figures 2 and 3).

According to EN 60947-5-1 section K.7.1.4.6.1., the following restrictions apply for positive opening contacts of design Za when used for safety applications.

If the control switch has changeover contact element of design C or Za, **only one contact element may be used** (closure or interruption). For changeover contact elements of design Zb, both contacts may be used.

Contact design Zb

Contact design Za

figure 2: correct

figure 3: incorrect

9 Contact blocks with different operating principle: slow action and snap action

Contact blocks with slow action: component where the speed of the contact movement (V_1) depends on the speed of the switch actuation (V). The contact carrier moves at a rate proportional to the actuation speed.

The slow action contact block is suitable for applications having low to medium currents and quick actuation movements. It has no differential travel.

$$V = V_1$$

Contact block with snap action: component where the speed of the contact movement (V_1) doesn't depend on the speed of the switch actuation (V). Upon reaching a predetermined point in the actuation travel, the contact carrier triggers and switches the contacts.

The snap action contact block is suitable for applications having high currents and/or slow actuation movements. This kind of contact block has a differential travel.

$$V \neq V_1$$

10 Contact blocks: diagrams of the force on the contacts

The following diagrams show the relationship between the force exerted on the contacts (F) and the actuation travel to the end position.

Contact block with slow action

Contact block with snap action and constant pressure: 5, 11, 12
The pressure on the contacts remains constant as the switching point is approached.

Contact block with snap action: 2, 3, 17
The pressure on the contacts decreases as the switching point is approached.

Contact blocks of the FD-FP-FL-FC-FR-FM-FX-FK-FW-FS series

1- Introduction

The purpose of this section is to provide the machine manufacturer with a quick overview of a number of standards related to machine safety, to clarify some basic terms and to provide some application examples. This brief guide only covers aspects related to the functional safety of the machine, i.e., all measures that must be taken to protect the operating personnel from the hazards arising from the operation of the machine, as well as the project planning and selection of the appropriate interlocking devices for the given guard.

The machine designer himself must identify risks that are posed by other hazards, such as live parts, pressurised containers, explosive atmospheres, etc. These risks are not dealt with in this guideline.

Pizzato Elettrica prepared this document to the best of its knowledge, taking into consideration the standards, interpretations and existing technologies. The examples provided here must always be considered by the end customer with respect to the latest state of technology and standardisation. Pizzato Elettrica accepts no responsibility for the examples provided here and does not exclude the possibility of unintentional errors or inaccuracies.

2 - Design in safety. Structure of the European standards

To freely market any type of device or machine in the countries of the European Community, they must comply with the provisions of the EU directives. They establish the general principles for ensuring that manufacturers place products on the market that are not hazardous to the operating personnel. The vast range of products pose many different hazards and, over time, has led to the release of various directives. As an example, consider the Low Voltage Directive 2014/35/EU, the Equipment for Explosive Atmospheres (ATEX) Directive 2014/34/EU, the Electromagnetic Compatibility Directive 2014/30/EU, etc. The hazards that arise from the operation of machinery are described in the Machinery Directive 2006/42/EC.

Conformity with the directives is certified by the Declaration of Conformity issued by the manufacturer and by the application of the CE marking on the machine.

For the assessment of risks posed by a machine and for the realisation of the safety systems for protecting the operating personnel from those risks, the European standardisation organisations CEN and CENELEC have issued a series of standards which translate the contents of the directives into technical requirements. The standards published in the Official Journal of the European Union are harmonised. The manufacturer is to verify conformity with the applied and listed standards.

The machine safety standards are divided into three types: A, B and C.

Type A standards: Standards that cover basic concepts and general principles for design in order to achieve safety in the design of machinery.

Type B standards: Standards that deal with one or more safety aspects and are divided into the following standards:

- B1: Standards on particular safety aspects (e.g. safety distances, temperature, noise, etc.)
- B2: Standards on safeguards (e.g. two-hand controls, interlocking devices, guards, etc.)

Type C standards: Standards that deal with detailed safety requirements for a particular group of machines (e.g. hydraulic presses, injection moulding machines, etc.)

The system or machine manufacturer must therefore determine whether the product is covered by a type C standard. If this is the case, this standard specifies the safety requirements; otherwise, the type B standards shall apply for any specific aspect or device of the product. In the absence of specifications, the manufacturer shall follow the general guidelines stated in the type A standards.

TYPE A STANDARDS

For example:

EN ISO 12100. Safety of machinery - General principles for design - Risk assessment and risk reduction.

TYPE B1 STANDARDS

For example:

EN IEC 62061. Safety of machinery - Functional safety of safety-related electrical, electronic and programmable electronic control systems
EN ISO 13849-1 e -2. Safety-related parts of control systems

TYPE B2 STANDARDS

For example:

EN ISO 13851. Two-hand control devices
EN ISO 13850. Emergency stop
EN ISO 14119. Interlocking devices associated with guards
EN 60204-1. Electrical equipment of machines
EN 60947-5-1. Electromechanical control circuit devices

TYPE C STANDARDS

For example:

EN ISO 20430. Plastics and rubber machines - Injection moulding machines
EN 415-1. Safety of packaging machines
EN ISO 16092-1 and EN ISO 16092-2. Mechanical presses
EN ISO 16092-1 and EN ISO 16092-3. Hydraulic presses
EN ISO 19085-6. Safety of wood-working machines - Part 1: Side moulding machines with rotating tool - Part 1: Single spindle vertical moulding machines

3 - Designing safe machines. Risk analysis

The first step in producing a safe machine is to identify the possible hazards to which the operators of a machine are exposed. The identification and classification of the hazards allows the risk for the operator or the combination of the probability of a hazard and the possible injury to be determined.

The methodology for risk analysis and evaluation and the procedure for the elimination/reduction of risks is defined by standard EN ISO 12100. This standard introduces a cyclic analysis model: starting with the initial objectives, the risk analysis and the various possibilities for reducing these risks are repeatedly evaluated until the initial objective is met.

The model introduced in this standard specifies that one proceed as follows after performing a risk analysis to reduce or eliminate risks:

- 1) Elimination of risks at their source through the use of intrinsically safe design principles and the structural set-up of the systems;
- 2) Risk reduction through safeguarding and monitoring systems;
- 3) Identification of residual risks through signalling and by informing the operating personnel.

Since every machine has hazards and because it is not possible to eliminate all possible risks, the objective is to reduce the residual risks to an acceptable level.

If a risk is reduced by means of a monitoring system, standard EN ISO 13849-1, which provides an evaluation model for the quality of this system, comes into play. If a given level is specified for a risk, it is possible to use a safety function of equal or higher level.

Note: This diagram was created by combining figures 1 and 3 of standard EN 13849-1. The texts in the diagram are not identical to those in the standard.

4 - Positive opening, redundancy, diversification and self-monitoring

Positive mode and negative mode.

According to the standard EN ISO 12100, if a moving mechanical component inevitably moves another component along with it, either by direct contact or via rigid elements, these components are said to be connected in the **positive** mode. Instead, if the movement of a mechanical component simply allows another element to move freely, without using direct force (for example by gravity force, spring effect, etc.), that connection is said to be connected in the **negative** mode.

With positive mode, preventive maintenance can be performed, thereby avoiding the dangerous failures described above. With negative mode, on the other hand, failures can occur within the switch and are therefore difficult to detect.

In the event of an internal failure (welded contacts or a damaged spring), the contacts will still open in positive mode in spite of the damage and the machine will be stopped.

Use of switches in safety applications

If only one switch is used in a safety application, the switch must be actuated in positive mode. In order to be used for safety applications, the opening contact (normally closed) must be with “**positive opening**.” All switches with the symbol  are provided with NC contacts with positive opening.

No flexible connection between the moving contacts and the actuator on which the actuating force is exerted.

In case of two or more switches, they should operate in opposite modes, for example:

- The first with an NC contact (normally closed contact), actuated by the guard in positive mode.
- The other with an NO contact (normally open contact), actuated by the guard in negative mode.

This is a common practice, though it does not exclude the possible use of two switches that are actuated in positive mode (see diversification).

Diversification

In redundant systems, safety is increased through **diversification**. This can be obtained by using two switches with different design and/or technology; failures with the same cause can thereby be prevented. Examples for diversification include: the use of one switch with positive actuation and one switch without positive actuation, the use of one switch with mechanical actuation and one switch without mechanical actuation (e.g., electronic sensor) or the use of two switches with mechanical, positive actuation but with different types of actuation (e.g., an FR 693-M2 key switch and a switch with FR 1896-M2 hinge pin).

Redundancy

Redundancy implies the use of more than one device or system to make sure that, in case of a failure in one device, there is another one available to perform the required safety functions. If the first failure is not detected, an additional failure may lead to the loss of the safety function.

Self-monitoring

Self-monitoring consists in an automatic control performed to check the functioning of all devices involved in the machine working-cycle. This way the next working cycle can be either accepted or rejected.

Redundancy and self-monitoring

Combining **redundancy** and **self-monitoring** in the same system makes sure that a first failure in the safety circuit does not lead to the loss of safety functions. This first failure will be detected at the next re-start or, in any case, before a second failure which may lead to the loss of the safety function.

5- Design and selection of interlocking devices associated with guards (standard EN ISO 14119)

In September 2024, the third edition of standard ISO 14119 “Interlocking devices associated with guards – Principles for design and selection” was published. This new edition introduces several interesting developments, particularly regarding the classification of devices and non-detachable fixing methods.

NEW ISO 14119:2024

The standard is intended for manufacturers of interlocking devices as well as machine manufacturers (and integrators) and describes the requirements on the devices and their correct installation. The new standard provides clarification to a number of questions that are not always clear cut and considers the latest technologies used in the design of interlocking devices, defines a number of parameters (actuator type and coding level) and describes the procedure for correct installation with the goal of minimizing the defeat possibilities of the interlocking devices. The standard also considers other aspects related to interlocking devices (e.g. guard locking principles, electromagnetic guard locking, auxiliary release, escape and emergency release, etc.) which are not described here.

Coding level of the actuators

- The standard includes the definition of a coded actuator and the classification of the coding levels:
- **coded actuator** – actuator which was specially designed for use with a specific interlocking device;
 - **Actuator with low coding level** – coded actuator for which 1 to 9 variations in code are available (e.g. the SR magnetic switch series or the safety switches with separate actuator and mechanical detection FS, FG, FR, FD...);
 - **actuator with medium coding level** – coded actuator for which 10 to 1000 variations in code are available;
 - **Actuator with high coding level** – coded actuator for which more than 1000 variations are available. (e.g. the ST series sensors with RFID technology or the interlocking devices of the NG, NS and NX series with RFID technology and guard locking).

Types of interlocking devices

- The third edition of standard ISO 14119 introduces a new type of interlocking device, type 5 for trapped-key devices, in addition to those already included in the second edition:
- **Type 1 interlocking device** – interlocking device that is mechanically actuated by an uncoded actuator (e.g. HP series hinged interlocking devices).
 - **Type 2 interlocking device** – interlocking device that is mechanically actuated by a coded actuator (e.g. safety switches with separate actuator of the FR, FS, FG, ... series).
 - **Type 3 interlocking device** – interlocking device that is contactlessly actuated by an uncoded actuator.
 - **Type 4 interlocking device** – interlocking device that is contactlessly actuated by a coded actuator (e.g. ST series safety sensors with RFID technology and NG, NS and NX series safety switches with RFID technology).
 - **Type 5 interlocking device** – Trapped-key interlocking device, which performs its function by locking or releasing one or more keys in a determined trapped-key interlocking system.

Type	Actuation principle	Actuator	Guard monitoring	Actuator examples		
				Actuation principle	Actuator	Annex
Type 1	Mechanical	Uncoded	Direct	Physical contact/force	Rotary cam	A.1
					Linear cam	A.2, A.4
					Hinge	A.3
Type 2	Mechanical	Coded	Direct	Physical contact/force	Key-actuated	B.1
Type 3	Non-contact	Uncoded	Direct	Magnetic	Magnet, solenoid	C.1
				Inductive	Ferrous metal	
				Capacitive	Any suitable object	
				Ultrasonic	Any suitable object	
				Optic	Any suitable object	
Type 4	Non-contact	Coded	Direct	Magnetic	Coded magnet	D.1
				RFID	Coded RFID tag	D.2
				Optic	Optically coded tag	-
Type 5	Mechanical (trapped key)	Coded	Indirect or direct		Profiled	K

From ISO 14119:2024 - Table 2

Requirements for the design and the installation of interlocking devices according to ISO 14119:2024 to reduce defeating of guards.

Principles and measures against defeating	Reference	Type 1 devices		Type 2 and type 4 devices	
		Cam safety switches rotary or linear cam	Safety hinge switches	Actuators with low and medium coding level	Actuators with high coding level
					
Additional interlocking device and plausibility check	8.3 d) 2)	R		R	
Installation out of reach (1)	8.3 a) 1)	X		X	
Barriers or shielding (2)	8.3 a) 2)				
Installation in hidden position (3)	8.3 a) 3)				
Testing by means of control circuit (4)	8.3 d) 1)				
Non-detachable fixing of the actuator	8.3 c)			M	M
Non-detachable fixing of the device	8.3 c)			R	R
Non-detachable fixing of device and actuator	8.3 c)	X	M		

From ISO 14119:2024 - Table 5

Legend: **X** = mandatory to apply at least one of the measures listed in the “Principles and measures” column; **M** = mandatory measure; **R** = recommended measure.

It is clear that the use of devices with RFID technology, high coding level and hinged switches is the easiest way to meet the requirements of ISO 14119, as it is only necessary to fulfil a few requirements in order to prevent defeating of guards.

Devices with low or medium coding level require additional measures to ensure a tamperproof application.

(1) - Installation out of reach

(2) - Barriers or shielding

(3) - Installation in hidden position

(4) - Status monitoring or periodic testing can, for example, be performed on a machine with a simple operating cycle so as to verify that the guards are actually open at the end of or during specific operating phases (e.g. to remove the processed material or to perform quality controls). If status monitoring does not detect opening of the guard, an alarm is generated and the machine is stopped.

Non-detachable fixing

Non-detachable fixing is one of the solutions indicated by the standard to prevent disassembly or repositioning of the elements composing an interlocking device. The standard also provides some examples of non-detachable fixing. In particular, the third edition formally introduces **the possibility of using caps on the openings of bolts and screws that can only be removed by breaking them**. The examples given in the standard are:

- welding;
- glueing of the thread (strong enough to require either heat or a chemical agent for removal);
- one-way screws;
- riveting;
- grinding of slots on the heads of screws to prevent their removal;
- filling the openings of bolts and screws (with plastic, resin, **covers or caps that can only be removed by breaking them** or a metal sphere).

Guard locking devices and holding force

The manufacturer of the interlocking device with guard locking must ensure that the device can withstand at least the measured holding force F_{ZH} while the interlock is engaged. This holding force must not exceed the maximum holding force divided by a safety coefficient equal to 1.3.

Example: A device with maximum holding force of $F_{ZH} = 2000$ N must pass a test with a maximum holding force equal to $F_{TEST} = 2600$ N. An interlocking device with guard locking can both monitor the position of the guard (open/closed) as well as lock the guard (locked/unlocked). Each of the two functions may require a different PL safety level (acc. to EN ISO 13849-1). The guard locking function generally requires a lower PL than the position monitoring function. (See paragraph 9.3, note 2 of ISO 14119:2024).

To identify whether an interlocking device also performs status monitoring, the standard specifies that the product label includes the symbol shown to the side here.

6 - Current status of the standards. Reason for changes, new standards and some overlapping

The “traditional” standards for functional safety, such as EN 954-1, played a large part in formalising some of the basic principles for the analysis of safety circuits on the basis of deterministic principles. On the other hand, they make no mention of the topic of programmable electronic control systems and are not generally in line with the current state of technology. To take programmable electronic control systems into account in the analysis of safety circuits, the approach taken by current standards is fundamentally probabilistic and introduces new statistical variables.

This approach is based on IEC 61508, which deals with the safety of complex programmable electronic systems and is very extensive (divided into 8 sections with nearly 500 pages). It is also used in a diverse range of application fields (chemical industry, machine construction, nuclear plants). This standard introduces the SIL concept (Safety Integrity Level), a probabilistic indication of a system's residual risk.

From IEC 61508 comes EN IEC 62061, which covers the functional safety of the complex electronic or programmable control systems in industrial applications. The concepts introduced here permit general use for any safety-related electrical, electronic and programmable electronic control systems (systems with non-electrical technologies are not covered).

EN ISO 13849-1, developed by CEN under the aegis of ISO, is also based on this probabilistic approach. This standard, however, attempts to structure the transition to the concepts in a less problematic way for the manufacturer, who is accustomed to the concepts of EN 954-1. The standard covers electromechanical, hydraulic, “non-complex” electronic systems and some programmable electronic systems with predefined structures. EN ISO 13849-1 is a type B1 standard and introduces the PL concept (Performance Level); as with SIL, the concept provides a probabilistic indication of a machine's residual risk. This standard points out a correlation between SIL and PL; concepts borrowed by EN 61508 – such as DC and CCF – are used and a connection to the safety categories of EN 954-1 is established.

In the area of functional safety for the safety of control circuits, there are thus two standards presently in force:

EN ISO 13849-1. Standard type B1, which uses the PL concept.

EN IEC 62061. Standard type B1, which uses the SIL concept.

Important note

EN 13849-1 is a type B1 standard; if a type C standard is already applied for a machine, the type C standard is to be used. Some type C standards not yet updated are based on the concepts of EN 954-1. For manufacturers of machines that are covered by a type C standard, the introduction time of the new standards depends on how quickly the various technical committees update the C standards.

There is clear overlapping of the two standards EN IEC 62061 and EN ISO 13849-1 concerning their application field and many aspects are similar; there is also a link between the two symbol names (SIL and PL), which indicate the result of the analyses according to the two standards.

PL EN ISO 13849-1	a	b	c	d	e
SIL EN IEC 62061 - IEC 61508	-	1	1	2	3
PFH _D	10 ⁻⁵ to 10 ⁻⁴	3x10 ⁻⁶ to 10 ⁻⁵	10 ⁻⁶ to 3x10 ⁻⁶	10 ⁻⁷ to 10 ⁻⁶	10 ⁻⁸ to 10 ⁻⁷
A hazardous failure every n years	from ~1 to ~10	from ~10 to ~40	from ~40 to ~100	from ~100 to ~1000	from ~1000 to ~10000

The choice of the standard to be applied is left to the manufacturer according to the technology that is used. We believe that standard EN ISO 13849-1 is easier to use thanks to its mediatory approach and the re-utilisation of the concepts already introduced on the market.

7- Standard EN ISO 13849-1 and the new parameters: PL, MTTF_D, DC, CCF

Standard EN ISO 13849-1 offers the manufacturer an iterative method for assessing whether the hazards posed by a machine can be reduced to an acceptable residual level through the use of appropriate safety functions. The applied method specifies a hypothesis-analysis-validation cycle for each risk. Once completed, it must be possible to demonstrate that every selected safety function is appropriate for the respective risk.

The first step involves the determination of the required performance level, which is required of each safety function. Like EN 954-1, EN ISO 13849-1 also uses a risk graph for the risk analysis of a machine function (figure A.1). Instead of a safety category, however, this graph is used to determine – as a function of the risk – a Required Performance Level or PL_r for the safety function which protects the respective part of the machine.

Starting with point 1 of the graph, the machine manufacturer answers questions S, F and P and can then determine the PL_r for the safety function being examined. He must then develop a system with a performance level PL that is equal to or greater than that which is required to protect the operating personnel.

Risk graph for determining the required PL_r for the safety function (excerpt from EN ISO 13849-1, figure A.1)

Legend

- 1 Starting point for the evaluation of the safety function's contribution to risk reduction
L Low contribution to risk reduction
H High contribution to risk reduction
PL_r Required performance level

* F1 should be selected if the total duration of the exposure to the hazard does not exceed 1/20 of the total work time and the frequency of exposure to the hazard does not exceed once every 15 minutes

** If there are no other reasons, F2 should be selected if the frequency of exposure to the hazard is greater than once every 15 minutes.

Risk parameters

- S** Severity of injury
S1 Slight (normally reversible injury)
S2 Serious (normally irreversible injury or death)
F Frequency and/or exposure to hazard
***F1** Seldom-to-less-often and/or exposure time is short
****F2** Frequent-to-continuous and/or exposure time is long
P Possibility of avoiding hazard or limiting harm
P1 Possible under specific conditions
P2 Scarcely possible

Note: For a machine manufacturer, it may be of interest forego repeating the risk analysis of the machine and to instead try and reuse the data already derived from the EN 954-1 risk analysis.

This is not generally possible, since the risk graph changed with the new standard (see previous figure) and, as a result, the required performance level of the safety function may have changed with identical risks. The German Institute for Occupational Safety and Health (BGIA), in its report 2008/2 on EN ISO 13849-1, recommends the following: assuming the "worst case," implementation can occur according to the table to the right. For further information, refer to the mentioned report.

Category required by EN 954-1		Required performance level (PL _r) and category acc. to EN ISO 13849-1
B	→	b
1	→	c
2	→	d, Category 2
3	→	d, Category 3
4	→	e, Category 4

There are five performance levels, from PL a to PL e, with increasing risk; each represents a numerical range for the average probability of a dangerous failure per hour. For example, PL d specifies that the average probability of dangerous failures per hour is between 1×10^{-6} and 1×10^{-7} , i.e., about 1 dangerous failure every 100-1000 years.

PL	Average probability of dangerous failures per hour PFHd (1/h)	
a	$\geq 10^{-5}$	and $< 10^{-4}$
b	$\geq 3 \times 10^{-6}$	and $< 10^{-5}$
c	$\geq 10^{-6}$	and $< 3 \times 10^{-6}$
d	$\geq 10^{-7}$	and $< 10^{-6}$
e	$\geq 10^{-8}$	and $< 10^{-7}$

Several parameters are needed to determine the PL of a control system:

1. The safety category of the system, which is dependent on the architecture (structure) of the control system and its behaviour in the event of damage
2. MTTF_D of the components
3. DC or Diagnostic Coverage of the system
4. CCF or Common Cause Failures

Safety category.

Most control circuits normally used can be represented with the following logic components:

- Input or signal input
- Logic or signal processing logic
- Output or output of the monitoring signal

These are connected to one another differently depending on the structure of the control circuit.

EN ISO 13849-1 allows for five different basic circuit structures, referred to as the designated architectures of the system. As shown in the following table, the architectures – combined with the requirements on the system behaviour in the event of failure and the minimum values of $MTTF_D$, DC and CCF – give the safety category of the system control. Thus, the safety categories of EN ISO 13849-1 are not the equivalent, but rather extend the concept of the safety category introduced by the previous standard EN 954-1.

Category	Summary of the requirements	System behaviour	Safety principles	$MTTF_D$ of each channel	DC_{avg}	CCF
B	Safety-related parts of monitoring systems and/or their protective equipment, as well as their accessories, must be designed, constructed, selected, assembled and combined in accordance with the relevant standards so that they can withstand the expected influences. Fundamental safety principles must be used. Architecture: 	The occurrence of a fault can lead to the loss of the safety function.	Mainly determined by the selection of components	Low to medium	None	Not relevant
1	In addition to the requirements of Category B, proven components and safety principles must be used. Architecture: 	The occurrence of a fault can lead to the loss of the safety function; the probability of fault occurrence is, however, lower than for Category B.	Mainly determined by the selection of components	High	None	Not relevant
2	Requirements of Category B and proven safety principles must be used. The safety function must be checked at appropriate intervals by the control system.  Architecture: 	The occurrence of a fault between two checks can lead to the loss of the safety function. The loss of the safety function is detected through the check.	Determined mainly by the structure	Low to high	Low to medium	See Annex F
3	Requirements of Category B and proven safety principles must be used. Important safety-related parts must be designed so that: - A single fault in any of these parts does not lead to the loss of the safety function. - Where reasonably practicable, the single fault is detected.  Architecture: 	If a single fault occurs, the safety function is always performed. Some, but not all faults are detected. Accumulation of undetected faults can lead to the loss of the safety function.	Determined mainly by the structure	Low to high	Low to medium	See Annex F
4	Requirements of Category B and proven safety principles must be used. Important safety-related parts must be designed, so that: - a single fault in any of these parts does not lead to the loss of the safety function, and - a single fault during or before the next request for the safety function is detected. If this is not possible, the accumulation of undetected faults must not lead to the loss of the safety function.  Architecture: 	If a single fault occurs, the safety function is always performed. The detection of accumulated faults reduces the probability of the loss of the safety function (high DC). The faults are detected in time to prevent the loss of the safety function.	Determined mainly by the structure	High	High (including accumulation of faults)	See Annex F

MTTF_D ("Mean Time To Dangerous Failure").

This parameter is used to determine the functional system quality over the mean lifetime in years before a dangerous failure occurs (other failures are not considered). The calculation of the MTTF_D is based on numerical values supplied by the manufacturers of the individual components of the system. In the absence of this data, the values can be taken from the tables with guide values included in the standard (EN ISO 13849-1 Annex C). The evaluation results in a numerical value, divided into three categories: High, Medium or Low.

Classification	Values
Not acceptable	MTTF _D < 3 years
Low	3 years ≤ MTTF _D < 10 years
Medium	10 years ≤ MTTF _D < 30 years
High	(30 years ≤ MTTF _D ≤ 100 years)

For components that are susceptible to high wear (typical for mechanical and hydraulic devices), the manufacturer supplies the value B_{10D} for the component, i.e., the number of component operations within which 10% of the samples failed dangerously, instead of the MTTF_D of the component.

The B_{10D} value of the component must be converted to MTTF_D by the machine manufacturer using the following formula:

$$MTTF_D = \frac{B_{10D}}{0,1 \cdot n_{op}}$$

Where n_{op} = means number of annual operations for the component.

By assuming the daily operating frequency and the daily operating hours for the machine, n_{op} can be calculated as follows:

$$n_{op} = \frac{d_{op} \cdot h_{op} \cdot 3600s/h}{t_{ciclo}}$$

where

d_{op} = work days per year

h_{op} = operating hours per day

t_{cycle} = cycle time (s)

For components that are susceptible to wear, note that parameter MTTF_D is dependent not only on the component itself but also on the application. An electromechanical device with low frequency of use, e.g. a remote switch that is only used for emergency stops, has a high MTTF_D; if the same device is used for normal processes in the operating cycle, the MTTF_D of the same remote switch could drop dramatically.

All elements of the circuit contribute to the calculation of the MTTF_D depending on their structure. In control systems with single-channel architecture (as is the case in categories B, 1 and 2), the contribution of each components is linear and the MTTF_D of the channel is calculated as follows:

$$\frac{1}{MTTF_D} = \sum_{i=1}^N \frac{1}{MTTF_{D_i}}$$

To avoid overly optimistic designs, the maximum value of the MTTF_D of each channel is limited to 100 years (for categories B, 1, 2 and 3) or 2500 years (category 4). Channels with an MTTF_D of less than 3 years are not allowed.

For two-channel systems (categories 3 and 4), the MTTF_D of the circuit is calculated by averaging the MTTF_D of the two channels using the following formula:

$$MTTF_D = \frac{2}{3} \left[MTTF_{DC1} + MTTF_{DC2} - \frac{1}{\frac{1}{MTTF_{DC1}} + \frac{1}{MTTF_{DC2}}} \right]$$

DC ("Diagnostic Coverage").

This parameter provides information on the effectiveness of a system's ability to self-detect any possible failures within the system. Using the percentage of the detectable dangerous failures, one obtains a diagnostic coverage of better or worse quality. The numerical DC parameter is a percentage value which is calculated using values taken from a table (EN ISO 13849-1 Annex E). Depending on the measures for failure detection taken by the manufacturer, example values are provided there. Because multiple measures are normally taken to rectify different anomalies in the same circuit, an average value or a DC_{avg} is calculated and can be assigned four levels:

High DC_{avg} ≥ 99%

Medium 90% ≤ DC_{avg} < 99%

Low 60% ≤ DC_{avg} < 90%

None DC_{avg} < 60%

A diagnostic coverage of none is only permissible for systems of category B or 1.

CCF ("Common Cause Failures")

For the calculation of the PL for systems of category 2, 3 or 4, it is also necessary to evaluate possible common cause failures or CCF, which may compromise the redundancy of the system. The evaluation is performed using a checklist (Annex F of EN ISO 13849-1); on the basis of the measures taken against common cause failures, points from 0 to 100 are assigned. The minimum permissible value for categories 2, 3 and 4 is 65 points.

PL ("Performance Level")

Given these data, the EN ISO 13849-1 standard provides the PL of the system through a correlation table (Annex K, EN ISO 13849-1) or, alternatively, using a simplified graphic (section 4.5 of EN ISO 13849-1), through the following figure:

This figure is very useful, as it can be read from multiple points of view. For a given PL_r , it shows all possible solutions with which this PL can be achieved, i.e., the possible circuit structures that provide the same PL.

Considering the figure more closely, it is seen that the following possibilities exist for a system with PL equal to "c":

1. Category 3 system with less reliable components ($MTTF_D$ =low) and medium DC.
2. Category 3 system with reliable components ($MTTF_D$ =medium) and low DC.
3. Category 2 system with reliable components ($MTTF_D$ =medium) and medium DC.
4. Category 2 system with reliable components ($MTTF_D$ =medium) and low DC.
5. Category 1 system with very reliable components ($MTTF_D$ =high).

Considering a given circuit structure, in this figure one can also identify the maximum PL that can be reached depending on the average diagnostic coverage and the $MTTF_D$ of the components.

Thus, the manufacturer can exclude a number of circuit structures in advance, as they do not meet the required PL_r .

However, the figure is not usually used to determine the PL of the system since the graphic areas overlap the boundaries of the different PL levels in many cases. Instead, the table in Annex K of standard EN ISO 13849-1 is used to precisely determine the PL of the circuit.

[illegible]This image shows a full page of blank graph paper. The grid consists of small, equal-sized squares formed by thin, dark gray lines. There are no margins, text, or other markings on the page.

Table of safety parameters

The B_{10D} data in the table refers to the mechanical life of the device contacts under normal ambient conditions.
 The value of B_{10D} for NC and NO contacts refers to a maximum electrical load of 10% of the current value specified in the utilisation category. Mission time (for all articles listed below): 20 years.

B₁₀₀: Number of operations after which 10% of the components have failed dangerously

B₁₀: Number of operations after which 10% of the components have failed

B₁₀/B₁₀₀: Ratio of total failures to dangerous failures.

MTTF_D: Mean Time To Dangerous Failure expressed in years

① = Depending on the base module

DC: Diagnostic Coverage

PFH_D: Probability of Dangerous Failure per hour

SIL CL: Safety Integrity Level Claim Limit. Maximum achievable SIL according to EN IEC 62061

PL: Performance Level. PL acc. to EN ISO 13849-1

EXAMPLE 1**Application: Guard monitoring**

Reference standard EN ISO 13849-1

Safety category **1**Performance Level **PL c****Description of the safety function**

The control circuit illustrated above has a guard monitoring function. If the guard is open the engine must not be able to start. The hazard analysis showed that the system has no inertia or rather that the engine, once the power has been switched off, stops at a much faster rate than the opening of the guard. The risk analysis has shown that the required PL_r target is PL c. This is necessary to verify if the intended control circuit with single channel structure is provided with a PL higher or equal to PL_r .

The guard position is detected by the switch with separate actuator SS1, which operates directly on the contactor KM1. The contactor KM1 monitoring the moving parts is usually activated by the Start and Stop buttons. Though, the analysis of the working cycle has shown that the guard is opening at every switching operation too. Therefore, the number of switch operations by the contactor and by the safety switch can be considered equal.

A circuit structure is defined as single-channel without supervision (category B or 1) if there are only an Input component (switch) and an Output (contactor) component.

In case a failure on one of the two devices the safety function is not guaranteed anymore.

No measures for fault detection have been applied.

Device data:

- SS1 (FX 693-M2) is a switch with positive opening (in accordance with EN 60947-5-1, Annex K). The switch is a well-ried component according to EN ISO 13849-2 table D.4. The B_{10D} value of the device supplied by the manufacturer is equal to 2,000,000 switching operations.
- KM1 is a contactor operated at nominal load and is a well-ried component in compliance with EN ISO 13849-2, table D.4. The B_{10D} value of this component is equal to 1,300,000 switching operations. This value results from the tables of the applicable standard (see EN ISO 13849-1, table C.1).

Assumption of the frequency of use

- It is assumed that the equipment is used for a maximum of 365 days per year, for three shifts of 8 hours and 600 s cycle time. For the switch, the number of switching operations per year is equal to maximum $N_{op} = (365 \times 24 \times 3,600) / 600 = 52,560$.
- It is assumed that the start button is operated every 300 seconds. Therefore, the maximum number of switching operations per year is equal to $n_{op}/year = 105,120$
- The contactor KM1 is actuated both for the normal start-stop of the machine as well as for the restart after a guard opening. $n_{op}/year = 52,560 + 105,120 = 157,680$

MTTF_d calculation

The $MTTF_d$ of the SS1 switch is equal to: $MTTF_d = B_{10D} / (0.1 \times n_{op}) = 2,000,000 / (0.1 \times 52,560) = 381$ years

The $MTTF_d$ of the KM1 contactor is equal to: $MTTF_d = B_{10D} / (0.1 \times n_{op}) = 1,300,000 / (0.1 \times 157,680) = 82$ years

Therefore, the $MTTF_d$ of the single-channel circuit is equal to: $1 / (1/381 + 1/82) = 67$ years

Diagnostic Coverage DCavg

No measures for fault detection have been applied and there is therefore no diagnostic coverage, a permissible condition for the circuit in question that is in category 1.

CCF Common Cause Failures

The CCF calculation is not required for category 1 circuits.

PL determination

Using the graph or the figure no. 5 of the standard, it can be verified that for a Category 1 circuit with $MTTF_d = 95$ years the resulting PL of the control circuit is PL c. The PL_r target is therefore achieved.

EXAMPLE 2**Application: Emergency stop control**

Reference standard EN ISO 13849-1

Safety category

3

Performance Level

PL e**Description of the safety function**

The operation of one of the emergency devices causes the intervention of the safety module and the two contactors KM1 and KM2. The signal of the devices ES1, ES2, ES3 is redundantly read by the CS safety module. The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS via the feedback circuit too.

Device data:

- The devices ES1, ES2, ES3 (FD 978-M2) are rope switches for emergency stop with positive opening. The B_{10D} value is 2,000,000
- KM1 and KM2 are contactors operated at nominal load. The B_{10D} value is 1,300,000 (see EN ISO 13849-1 - Table C.1)
- CS is a safety module (CS AR-20) with $MTTF_D = 225$ years and DC High
- The circuit structure is two-channel in category 3

Assumption of the frequency of use

- Twice a month, nop/year = 24
- Start button actuation: 4 times a day
- Assuming 365 working days, the contactors will take action $4 \times 365 + 24 = 1484$ times / year
- The switches will be operated with the same frequency.
- It is not expected that multiple buttons will be pressed simultaneously.

MTTF

d calculation

- $MTTF_{D, ES1, ES2, ES3} = 833,333$ years
- $MTTF_{D, KM1, KM2} = 8760$ years
- $MTTF_{D, CS} = 225$ years
- $MTTF_{D, ch1} = 219$ years. The value must be limited to 100 years. The channels are symmetric, therefore $MTTF_D = 100$ years (High)

Diagnostic Coverage DC_{avg}

- The contacts of KM1 and KM2 are monitored by the CS module via the feedback circuit. DC = 99% (High)
- The safety module CS AR-20 is provided with a "High" diagnostic coverage.
- Not all failures in the series of emergency devices can be detected. The diagnostic coverage is 90% (Medium)

CCF Common Cause Failures

We assume a score > 65 (acc. to EN ISO 13849-1 - Annex F).

PL determination

A circuit in category 3 with $MTTF_D = \text{High}$ and $DC_{avg} = \text{High}$ can reach a PL e.

EXAMPLE 3**Application: Guard monitoring**

Reference standard EN ISO 13849-1

Safety category

4

Performance Level

PL e**Description of the safety function**

The guard opening causes the intervention of the switches SS1 and SS2 and, by consequence, of the safety module and the KM1 and KM2 contactors too.

The signal of the devices SS1 and SS2 is redundantly monitored by the CS safety module.

The switches have different operating principles.

The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS via the feedback circuit too.

Device data:

- The switch SS1 (FR 693-M2) is a switch with positive opening. The B_{10D} value is 2,000,000
 - The switch SS2 (FR 1896-M2) is a hinge switch with positive opening. $B_{10D} = 5,000,000$
 - KM1 and KM2 are contactors operated at nominal load. $B_{10D} = 1,300,000$ (see EN ISO 13849-1 - Table C.1)
 - The CS modules are safety modules (CS AR-01) with $MTTF_d = 227$ years and DC = High
- Assumption of the frequency of use
365 days/year, 16 h/day, 1 action every 4 minutes (240 s). $n_{op}/year = 87,600$.

MTTF_d calculation

- $MTTF_{D_{SS1}} = 228$ years
- $MTTF_{D_{SS2}} = 571$ years
- $MTTF_{D_{KM1, KM2}} = 148$ years
- $MTTF_{D_{CS}} = 227$ years
- $MTTF_{D_{CH1}} = 64$ years (SS1, CS, KM1)
- $MTTF_{D_{CH2}} = 77$ years (SS2, CS, KM2)
- $MTTF_D$: by calculating the average of the two channels $MTTF_D = 70.7$ years (High) is achieved

Diagnostic Coverage DC_{avg}

- SS1 and SS2 have DC = 99% since the SS1 and SS2 contacts are monitored by CS and have different operation principles.
- The contacts of KM1 and KM2 are monitored by the CS module via the feedback circuit. DC = 99% (High)
- CS AR-01 is provided with an internal redundant and self-monitoring circuit. DC = High
- $DC_{avg} = High$

PL determination

A circuit in category 4 with $MTTF_D = 72.1$ years and $DC_{avg} = High$ corresponds to PL e.

EXAMPLE 4

Application: Guard monitoring

Reference standard EN ISO 13849-1

Safety category

4

Performance Level

PL e

Description of the safety function

The opening of a guard triggers switches SS1 and SS2 on the first guard and triggers SS3, SS4 on the second; the switches trigger the safety module and both contactors KM1 and KM2.

The signal of the devices SS1, SS2 and SS3, SS4 is redundantly monitored by the CS safety module. Furthermore, an auxiliary contact of the switch is monitored by the PLC.

The switches have different operating principles.

The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS via the feedback circuit too.

Device data:

- The switches SS1, SS3 (FR 693-M2) are switches with positive opening. The B_{10D} value is 2,000,000
- The switches SS2, SS4 (FR 1896-M2) are hinge switches with positive opening. $B_{10D} = 5,000,000$
- KM1 and KM2 are contactors operated at nominal load. The B_{10D} value is 1,300,000 (see EN ISO 13849-1 - Table C.1)
- CS is a safety module (CS AR-05) with $MTTF_D = 152$ years and DC = High

Assumption of the frequency of use

- 4 times per hour for 24 h/day for 365 days/year equal to $n_{op}/year = 35,040$
- The contactors will operate for twice the number of operations = 70,080

MTTF

- $MTTF_{D, SS1, SS3} = 571$ years; $MTTF_{D, SS2, SS4} = 1,427$ years
- $MTTF_{D, KM1, KM2} = 185$ years
- $MTTF_{D, CS} = 152$ years
- $MTTF_{D, Ch1} = 73$ years (SS1, CS, KM1) / (SS3, CS, KM1)
- $MTTF_{D, Ch2} = 79$ years (SS2, CS, KM2) / (SS4, CS, KM2)
- $MTTF_{D, avg}$: by calculating the average of the two channels $MTTF_{D, avg} = 76$ years (High) is achieved

Diagnostic Coverage DC_{avg}

- The contacts of KM1, KM2 are monitored by the CS module via the feedback circuit. DC = 99%
- All auxiliary contacts of the switches are monitored by the PLC. DC = 99%
- The CS AR-05 module has a DC = High
- The diagnostic coverage for both channels is 99% (High)

CCF Common Cause Failures

- We assume a score > 65 (acc. to EN ISO 13849-1 - Annex F).

PL determination

- A circuit in category 4 with $MTTF_{D, avg} = 88.6$ years (High) and $DC_{avg} = High$ corresponds to PL e.

EXAMPLE 5**Application: Guard monitoring**

Reference standard EN ISO 13849-1

Safety category

4

Performance Level

PL e**Description of the safety function**

The opening of guards triggers the sensors SS1 on the first guard, SS2 on the second and SS3 on the third. The sensors trigger the safety module CS AR-08 and the contactors KM1 and KM2 too. The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS AR-08 via the feedback circuit.

Device data

SS1, SS2, SS3 are ST series coded sensors with RFID technology. $PFH_D = 1.20E-11$, PL = "e"

CS AR-08 is a safety module. $PFH_D = 9.73E-11$, PL = "e"

KM1 and KM2 are contactors operated at nominal load. $B_{10D} = 1,300,000$ (see EN ISO 13849-1 - Table C.1)

Assumption of the frequency of use

Each door is opened every 2 minutes, 16 hours a day, for 365 days a year, equal to $n_{op} = 175,200$

Definition of the SRP/CS and subsystems

The SRP/CS consists of 5 subsystems (SB):

SB1,2,3 represent the three ST series RFID sensors

SB4 represents the safety module CS AR-08

SB5 represents the two contactors KM1 and KM2 in redundant architecture (cat. 4)

 **PFH_D calculation for SB5**

$MTTF_D$ KM1, KM2 = 74.2 years.

DC = 99%, the contacts of KM1 and KM2 are monitored by the safety module via the feedback circuit.

For the CCF parameter we assume a score higher than 65 (acc. to EN ISO 13849-1 - Annex F).

A category 4 circuit with $MTTF_D = 74.2$ years (high) and high diagnostic coverage (DC = 99%) corresponds to a failure probability of $PFH_D = 3.4E-08$ and a PL "e".

Calculation of the total PFH_D of the SRP/CS

$$PFH_{DTOT} = PFH_{DSB1} + PFH_{DSB2} + PFH_{DSB3} + PFH_{DSB4} + PFH_{DSB5} = 3.5E-08$$

It corresponds to PL "e".

Calculation example performed with SISTEMA software, downloadable free of charge at www.pizzato.com

EXAMPLE 6**Application: Guard monitoring**

Reference standard EN ISO 13849-1

Safety category **4**Performance Level **PL e****Description of the safety function**

The opening of a guard triggers switches SS1 and SS2 on the first guard and triggers sensor SS3 on the second; the switches trigger the safety module and both contactors KM1 and KM2.

The signals from the SS1, SS2 and SS3 devices are redundantly monitored by the CS MF safety module.

There is also an emergency stop button which has a two-channel connection with the safety module too.

The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS MF via the feedback circuit too.

Device data:

- The switch SS1 (FR 693-M2) is a switch with positive opening. $B_{10D} = 2,000,000$
- The switch SS2 (FR 1896-M2) is a hinge switch with positive opening. $B_{10D} = 5,000,000$
- SS3 (SR AD40AN2) is a magnetic safety sensor. $B_{10D} = 20,000,000$
- SS4 (ES AC31005) is a housing with emergency stop button (E2 1PERZ4531) provided with 2 NC contacts. $B_{10D} = 600,000$
- KM1 and KM2 are contactors operated at nominal load. $B_{10D} = 1,300,000$ (see EN ISO 13849-1 - Table C.1)
- CS MF201M0-P1 is a safety module with $MTTF_D = 842$ years and $DC = 99\%$

Assumption of the frequency of use

- Each door is opened 2 times per hour for 16 h/day for 365 days/year equal to $n_{op}/year = 11,680$
- It is assumed that the emergency stop button is actuated at a maximum of once a day, $n_{op}/year = 365$
- The contactors will operate for twice the number of operations = 23,725

MTTF_D calculation**Guard SS1/SS2**

- $MTTF_{D, SS1, SS3} = 1,712$ years
- $MTTF_{D, SS2, SS4} = 4,281$ years
- $MTTF_{D, KM1, KM2} = 548$ years
- $MTTF_{D, CS} = 842$ years
- $MTTF_{D, CH1} = 278$ years (SS1, CS, KM1)
- $MTTF_{D, CH2} = 308$ years (SS2, CS, KM2)
- $MTTF_D$ = by calculating the average of the two channels $MTTF_D = 293$ years is achieved

Guard SS3

- $MTTF_{D, SS3} = 17,123$ years
- $MTTF_{D, KM1, KM2} = 548$ years
- $MTTF_{D, CS} = 842$ years
- $MTTF_D = 325$ years

Emergency stop button SS4

- $MTTF_{D, SS4} = 16,438$ years
- $MTTF_{D, KM1, KM2} = 548$ years
- $MTTF_{D, CS} = 842$ years
- $MTTF_D = 325$ years

Diagnostic Coverage DC_{avg}

- The contacts of KM1, KM2 are monitored by the CS MF module via the feedback circuit. $DC = 99\%$
- For the devices SS1, SS2 and SS3 it is possible to detect all faults. $DC = 99\%$
- The CS MF201M0-P1 module has a $DC = 99\%$
- We assume a diagnostic coverage of 99% (High)

CCF Common Cause Failures

- We assume a score > 65 (acc. to EN ISO 13849-1 - Annex F).

PL determination

- A circuit in category 4 with $MTTF_D \geq 30$ years (High) and $DC_{avg} = \text{High}$ corresponds to PL e.
- The safety functions associated to the guards SS1/SS2, SS3 and the emergency stop button present the level PL e.

Any information or application example, connection diagrams included, described in this document are to be intended as purely descriptive.
The choice and application of the products in conformity with the standards, in order to avoid damage to persons or goods, is the user's responsibility.

EXAMPLE 7**Application: Guard monitoring**

Reference standard EN ISO 13849-1

Safety category **4**Performance Level **PL e**

Description of the safety function

Every machine is divided into 3 different zones. The access to each zone is monitored by the guards and 4 emergency stop buttons are present too.

The operation of an emergency stop button will trigger the CS MP safety module as well as the forcibly guided contactors KMA1/2, KMB1/2 and KMC1/2, and will therefore stop all motors.

The opening of a guard in zone A triggers the devices SS5 or SS6 and, as a consequence, the CS MP safety module as well as the contactors KMA1 and KMA2, and therefore also the stop of the MA motor. The devices SS5 and SS6 are connected to the CS MP safety module separately, with a two-channel connection.

The opening of the guard in zone B triggers the device SS7 and, as a consequence, the CS MP safety module as well as the contactors KMB1 and KMB2, and therefore also the stop of the MB motor. The SS7 hinge is provided with two OSSD outputs and is redundantly controlled by the CS MP safety module.

The opening of a guard in zone C triggers the devices SS8, SS9 or SS10 and, as a consequence, the safety module as well as the contactors KMC1 and KMC2, and therefore also the stop of the MC motor. The sensors SS8, SS9 and SS10 are interconnected via the OSSD outputs and are redundantly monitored by the CS MP safety module.

Device data

- SS1, SS2, SS3 and SS4 (ES AC31005) are emergency stop buttons (E2 1PERZ4531) provided with 2 NC contacts. $B_{10D} = 600,000$
- SS5 and SS6 (SR AD40AN2) are magnetic safety sensors. $B_{10D} = 20,000,000$
- SS7 (HX BEE1-KSM) is a safety hinge with OSSD outputs. $MTTF_D = 4,077$ years / DC = 99%
- SS8, SS9 and SS10 (ST DD310MK-D1T) are safety sensors with RFID technology and OSSD outputs. $MTTF_D = 4,077$ years / DC = 99%
- KMA, KMB and KMC are contactors operated at nominal load. $B_{10D} = 1,300,000$ (see EN ISO 13849-1 - Table C.1)
- CS MP202M0 is a safety module with $MTTF_D = 2035$ years / DC = 99%

Assumption of the frequency of use

- Each door of zone A is opened 2 times per hour for 16 h/day for 365 days/year equal to $n_{op}/year = 11,680$. The contactors will operate for twice the number of operations = 23,360
- The door of zone B is opened 4 times per hour for 16 h/day for 365 days/year equal to $n_{op}/year = 23,360$. The contactors will operate for a given number of operations = 23,360
- Each door of zone C is opened 1 time per hour for 16 h/day for 365 days/year equal to $n_{op}/year = 5,840$. The contactors will operate for a given number of operations = 17,520
- It is assumed that the emergency stop button is actuated at a maximum of once a week, $n_{op}/year = 52$
- Fault Exclusion: since it is assumed that the pairs of contactors, connected in parallel to the respective safety outputs, are wired permanently within the switching cabinet, the possibility of short-circuit between +24V and the contactors is excluded (see Table D.4, item D.5.2 of EN ISO 13849-2).

MTTF_{d calculation}

Emergency stop buttons

- $MTTF_D$ SS1/SS2/SS3/SS4 = 115,384 years
- $MTTF_D$ CS = 2035 years
- $MTTF_D$ KMC1,KMC2 = 742 years
- $MTTF_D$ e-stop = 541 years

Guards, zone A

- $MTTF_D$ SS5/SS6 = 17,123 years
- $MTTF_D$ CS = 2035 years
- $MTTF_D$ KMA1,KMA2 = 556 years
- $MTTF_D$ A = 425 years (SS5/SS6,CS,KMA)

Guards, zone B

- $MTTF_D$ SS7 = 4,077 years
- $MTTF_D$ CS = 2035 years
- $MTTF_D$ KMB1,KMB2 = 556 years
- $MTTF_D$ B = 394 years (SS7,CS,KMB)

Guards, zone C

- $MTTF_D$ SS8/SS9/SS10 = 4,077 years
- $MTTF_D$ CS = 2035 years
- $MTTF_D$ KMC1,KMC2 = 742 years
- $MTTF_D$ C = 479 years (SS8/SS9/SS10,CS,KMC)

Diagnostic Coverage DC_{avg}

- The contacts of KMA, KMB and KMC are monitored by the CS MP module via the feedback circuit. DC = 99%
- All faults in the various devices can be detected. DC = 99%
- The CS MP202M0 module has a DC = 99%
- The result is a diagnostic coverage of 99% for each function

CCF Common Cause Failures

- We assume a score > 65 for all safety functions (acc. to EN ISO 13849-1 - Annex F).

PL determination

- A circuit in category 4 with $MTTF_D \geq 30$ years (High) and DC_{avg} = High corresponds to PL e.
- All safety functions associated to the guards and the emergency stop buttons have PL e.

EXAMPLE 8**Application: Guard monitoring**

Reference standard EN ISO 13849-1

Performance Level - Safety function 1

PL e

Performance Level - Safety function 2

PL e

Description of the safety function

Interlocking devices SS1, SS2 and SS3 perform two safety functions: monitoring the locked state and locking the guard. Once the guards have been released, the three sensors trigger the safety module and the contactors KM1 and KM2 too. The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS AR-08 via the feedback circuit. The interlock command on the three devices SS1, SS2 and SS3 is maintained until the motor standstill monitoring module CS AM11 detects the actual stopping of movement.

Device data

SS1, SS2, SS3 are NS series coded interlock devices with RFID technology, with guard locking device. Locked protection detection function $PFH_D = 1.23E-09$ PL = "e", operating of locking control $PFH_D = 2.04E-10$ PL = "e".

CS AR-08 is a safety module, $PFH_D = 9.73 E-11$, PL = "e".

CS AM11 is a safety module for motor standstill monitoring, $PFH_D = 1.00E-09$, PL "e".

KM1 and KM2 are contactors operated at nominal load. $B_{10D} = 1,300,000$ (see EN ISO 13849-1 - Table C.1)

Assumption of the frequency of use

Each door is opened every 10 minutes, 16 hours a day, for 365 days a year, equal to $n_{op}/year = 35,040$

Definition of the SRP/CS and subsystems

This application example presents two safety functions:

1. Safety-related stop function initiated by a protective measure
2. Maintain interlock of the guard with motor M in motion

The safety function 1 is performed by an SRP/CS consisting of 5 subsystems (SB):

- SB11,12,13 represent the three RFID interlock devices of the NS series: SS1, SS2 and SS3
- SB14 represents the safety module CS AR-08
- SB15 represents the two contactors KM1 and KM2 in redundant architecture (cat. 4)

The safety function 2 is performed by 2 subsystems (SB):

- SB21 represents the CS AM11 safety module for motor standstill monitoring
- SB22 represents the three NS series RFID interlock devices

PFH_D calculation for SB15

$MTTF_D$ KM1,KM2 = 371 years.

DC = 99%, the contacts of KM1 and KM2 are monitored by the safety module via the feedback circuit.

For the CCF parameter we assume a score higher than 65 (acc. to EN ISO 13849-1 - Annex F).

A category 4 circuit with $MTTF_D = 371$ and high diagnostic coverage (DC = 99%) corresponds to a failure probability of $PFH_D = 6.3E-09$ and a PL "e".

Calculation of the total PFH_D of the SRP/CS safety function 1 (interlock)

$$PFH_{DTOT} = PFH_{DSB11} + PFH_{DSB12} + PFH_{DSB13} + PFH_{DSB14} + PFH_{DSB15} = 1E-08$$

It corresponds to PL "e".

Calculation of the total PFH_D of the SRP/CS safety function 2 (lock)

$$PFH_{DTOT} = PFH_{DSB21} + PFH_{DSB22} = 1.20E-09$$

It corresponds to PL "e".

Calculation example performed with SISTEMA software, downloadable free of charge at www.pizzato.com

EXAMPLE 9**Application: Guard monitoring**

Reference standard EN ISO 13849-1

Performance Level - Safety function 1

Performance Level - Safety function 2

PL e**PL d**

Description of the safety function

Interlocking devices SS1, SS2 and SS3 perform two safety functions: monitoring the locked state and locking the guard. Once the guards have been released, the three sensors act directly on contactors KM1 and KM2. Contactors KM1 and KM2 (with forcibly guided contacts) are controlled by the SS3 sensor, via EDM (External Device Monitoring) input I5. The interlock command on the three devices SS1, SS2 and SS3 depends on the closure of the safe contact of a CS FS-1 safety timer module. Each device will receive the unlock command, when the button mounted on the P-KUBE Krome handle is pressed.

Device data

SS1, SS2, SS3 are coded interlock devices with RFID technology, with guard locking device. Locked protection detection function $PFH_d = 1,17E-09$ PL = "e"; single channel locking control function $PFH_d = 1,51E-10$ PL = "d".

CS FS-1 is a safety timer module, $PFH_d = 5.06E-10$, PL "e".

KM1 and KM2 are contactors operated at nominal load. $B_{10D} = 1,300,000$ (see EN ISO 13849-1 - Table C.1)

Assumption of the frequency of use

Each door is opened every 10 minutes, 16 hours a day, for 365 days a year, equal to $n_{op} = 35,040$

Definition of the SRP/CS and subsystems

This application example presents two safety functions:

1. Safety-related stop function initiated by a protective measure
2. Maintain interlock of the guard with motor M1 in motion

The safety function 1 is performed by an SRP/CS consisting of 4 subsystems (SB):

- SB11,12,13 represent the three RFID interlock devices of the NG series: SS1, SS2 and SS3
- SB14 represents the two contactors KM1 and KM2 in redundant architecture (cat. 4)

The safety function 2 is performed by 2 subsystems (SB):

- SB21 represents the safety timer module CS FS-1
- SB22 represents the NG series RFID interlocking device

PFH_d calculation for SB14

$MTTF_D$ KM1,KM2 = 371 years.

DC = 99%, the KM1 and KM2 contacts are monitored by the last NG device in the series, via the EDM input.

For the CCF parameter we assume a score higher than 65 (acc. to EN ISO 13849-1 - Annex F).

A category 4 circuit with $MTTF_D = 371$ and high diagnostic coverage (DC = 99%) corresponds to a failure probability of $PFH_d = 6.3E-09$ and a PL "e".

Calculation of the total PFH_d of the SRP/CS safety function 1

$$PFH_{DTOT} = PFH_{DSB11} + PFH_{DSB12} + PFH_{DSB13} + PFH_{DSB14} = 9.8E-09$$

It corresponds to PL "e".

Calculation of the total PFH_d of the SRP/CS safety function 2

$$PFH_{DTOT} = PFH_{DSB21} + PFH_{DSB22} = 6.6E-10$$

That would correspond to PL "e". Considering however, that the NG device with single channel interlock command is characterized by a PL "d", the entire SRP/CS is downgraded to this value; therefore PL "d".

Definitions according to the EN 60947-1 and EN 60947-5-1 standards

Control switches

Devices or operating mechanisms for controlling the operation of equipment, including signalling, interlocking, etc.

Utilization category

Combination of specified requirements related to the conditions in which the switching device fulfils its purpose.

Operating cycle

Sequence of two operations, one for opening and one for closing.

Rated current I_e

This current depends on the rated operating voltage, the rated frequency, the utilization category and the type of protective enclosure, if present.

Thermal current I_{th}

Maximum current for heating tests on equipment without enclosure, in free air. Its value shall be least to equal to the maximum value of the rated operational current I_e of the equipment without enclosure, in eight-hour duty.

Electrical endurance

Number of on-load operating cycles, under the conditions defined by the corresponding product standard, which can be carried out without repair or replacement.

Mechanical endurance

Number of no-load operating cycles (i.e. without current on the main contacts), under the conditions defined by the corresponding product standard, which can be carried out without repair or replacement of mechanical parts.

Contact elements

The parts, fixed or movable, conducting or insulating, of a control switch necessary to close and open one single conducting path of a circuit.

Single interruption contact elements

Contact element opening or closing the circuit's conducting path at one point only.

Double interruption contact elements

Contact element opening or closing the circuit's conducting path at two points in series.

Make-contact elements (normally open)

Contact element closing a circuit's conducting path when the control switch is actuated.

Break-contact elements (normally closed)

Contact element opening a circuit's conducting path when the control switch is actuated.

Change-over contact elements

Contact element combination including one make-contact element and one break-contact element.

Electrically separated contact elements

Contact elements of the same control switch which are well isolated from each other and therefore can be connected to electric circuits with different voltages.

Contact elements with independent action (snap action)

Contact element of a manual or automatic device for control circuits where the motion speed of the contact is substantially independent from the motion speed of the actuator.

Contact elements with dependent action (slow action)

Contact element of a manual or automatic device for control circuits where the motion speed of the contact depends on the motion speed of the actuator.

Minimum actuating force

Minimum force to be applied to the actuator that will cause all contacts to reach their switched position.

Position switch

Control switch whose controller is actuated by a moving part of the machine, when this part arrives to a set position.

Foot switch

Control switch whose actuator is actuated by exerting force with a foot on the pedal.

Pre-travel of the actuator

The maximum travel of the actuator which does not cause any travel of the contact elements.

Ambient temperature

The air temperature surrounding the complete switching device, under prescribed conditions.

Rated operating voltage U_e

Voltage which, combined with the rated operational current I_e , determines the application of the equipment and the referred utilization categories.

Rated insulation voltage U_i

Reference voltage for the dielectric test voltage and the creepage distances along surfaces.

Rated impulse withstand voltage U_{imp}

The highest peak value of an impulse voltage, of a prescribed shape and polarity, which does not cause destructive discharge under the specified test conditions.

Contact block

Contact element or contact elements combination which can be combined with similar units, operated by a common actuating system.

Markings and quality marks

CE marking

The CE marking is a mandatory declaration made by the manufacturer of a product in order to indicate that the product satisfies all requirements foreseen by the directives (regulated by the European Community) in terms of safety and quality. Therefore, it ensures National bodies of the EU countries about the fulfilment of obligations laid down in the agreements.

IMQ mark

The IMQ (Italian Institute of the Quality Mark) is an association in Italy (independent third body) whose task is to check and certify the compliance of materials and equipment with safety standards (CEI standards in the electric and electronic sector). This voluntary conformity certification is a guarantee of quality, safety and technical value.

UL mark

UL (Underwriters Laboratories Inc.) is an independent non-profit body that tests materials, devices, products, equipment, constructions, methods and systems with regard to their risk for human life and goods according to the standard in force in the United States and Canada. Decisions made by UL are often recognized by many governing authorities concerning the compliance with local safety regulations.

CCC mark

The CQC is the organization in the Chinese Popular Republic whose task is to check and certify the low voltage electrical material. This organization issues the product mark CCC which certifies the passing of electrical/mechanical conformity tests by products and the compliance of the company quality system with required standards. To obtain the mark, the Chinese body makes preliminary company visits as well as periodical check inspections. Position switches cannot be sold in the Chinese territory without this mark.

TÜV SÜD mark

TÜV SÜD is an international authority claiming long-standing experience in the certification of operating safety for electrical, electromechanical and electronic products. In the course of type approval, TÜV SÜD closely inspects the quality throughout all the stages concerning product development, from software design and completion, to production and to the tests conducted according to ISO/IEC standards. The operating safety certification is obtained voluntarily and has a high technical value, since it not only certifies the electrical safety of the product, but also its specific operating suitability for use in safety applications according to the IEC 61508 standard.

EAC mark

The EAC certificate of conformity is a certificate issued by a Customs Union certification body formed by Russia, Belarus and Kazakhstan, with which the conformity of a product is certified with the essential safety requirements laid down by one or more Technical Regulations (Directives) of the Customs Union.

ECOLAB mark

ECOLAB is one of the world's leading providers of technologies and services for hygiene in food processing. ECOLAB certifies the compatibility of tested electrical devices in its own laboratories, using disinfectants and cleaning agents used in the area of food processing worldwide.

UKCA mark

Following the withdrawal of the United Kingdom from the European Union, the UKCA mark (UKCA Conformity Assessment) takes the place of the CE marking for the British market (England, Scotland and Wales).

The UKCA mark indicates that the product satisfies the British regulations. As in the European Union, conformity can be achieved through the application of harmonised standards, the so-called "designated standards".

The evaluation of the conformity can be performed through self-certification or through a certification process by an "approved body".

Protection degree of housings for electrical material according to EN 60529

The following table reports the required protection degrees according to the IEC 60529, EN 60529 standards.

The protection degrees are indicated by the abbreviation IP and 2 following digits. 2 additional letters can be reported indicating protection of persons or other features. The first digit shows the degree of protection against penetration of external solid materials. The second digit identifies instead the protection degree against liquid penetration.

1st digit	Description	Protection for the machine	Protection for persons	2nd digit	Description	Protection for the machine
0		Not protected	Not protected	0		Not protected
1		Protected against solid objects greater than 50 mm	Against access to hazardous parts with the back of a hand (Ø 50 mm)	1		Protected against vertically falling water drops
2		Protected against solid objects greater than 12 mm	Against access to hazardous parts with a finger (Ø 12 mm)	2		Protected against water drops falling at max. 15° angle
3		Protected against solid objects greater than 2.5 mm	Against access to hazardous parts with a tool (Ø 2.5 mm)	3		Protected against rain drops falling at max. 60° angle
4		Protected against solid objects greater than 1 mm	Against access to hazardous parts with a wire (Ø 1 mm)	4		Protected against splash water from any direction
5		Protected against dust	Against access to hazardous parts with a wire (Ø 1 mm)	5		Protected against powerful water jets from any direction (e.g. waves)
6		Totally protected against dust	Against access to hazardous parts with a wire (Ø 1 mm)	6		Protected against temporary water immersion (30 minutes at one-meter depth)
				7		Protected against continuous immersion in water
				8		

Protection degree IP69K according to ISO 20653

ISO 20653 envisages a particularly strenuous test. This test simulates the conditions of pressure washing in industrial environments with water jets having pressure between 80 and 100 bar, flow rate between 14 and 16 l/min. and a temperature of 80°C.

Test specifications:

Rotation speed (B):	5 ± 1 rpm
Distance from water jet (A):	$100 + 50/-0$ mm
Water flow rate:	15 ± 1 l/min
Water pressure:	9000 ± 1000 kPa
Water temperature:	80 ± 5 °C
Test duration:	30 s per position

Housing data in accordance with UL (UL 508) and CSA (C22.2 No. 14) approvals

The features required for a housing are determined by a specific environmental designation and other features such as the kind of gasket or the use of solvent materials.

Type	Intended use and description
1	Mainly for indoor utilization, supplied with protection against contact with the internal mechanism and against a limited quantity of falling dirt.
4X	Suitable for both indoor and outdoor use, provided with protection degree against falling rain, water splashes and direct coming water from a pipe. No damage caused by ice formation on the housing. Corrosion-resistant.
12	Indoor utilization, provided with a protection degree against dust, dirt, flying fibres, dripping water and outside condensation of non-corrosive fluids.
13	Indoor utilization, supplied with a protection degree against gauze, dust penetration, outside condensation and sprinkling of water, oil and non-corrosive fluids.

Pollution degree (of environmental conditions) according to EN 60947-1

According to the EN 60947-1 standard, the pollution degree is a conventional number based on the quantity of conducting hygroscopic dust, ionized gas or salt, and on the relative humidity and its frequency of occurrence resulting in hygroscopic absorption or condensation of moisture leading to reduction in dielectric strength and/or surface resistivity. In equipment to be used inside a housing or having an integral enclosure as part of the device, the pollution degree applies to the inner part of housing. With the purpose of evaluating the air and surface insulation distances, the following four pollution degrees are defined:

Degree	Description
1	No pollution or only dry and non-conductive pollution occurs.
2	Normally, only non-conductive pollution is present. Occasionally some temporary conductivity caused by condensation may occur.
3	Some conductive pollution is present, or some dry non-conductive pollution that becomes conductive because of condensation.
4	Pollution causes persistent conductivity, for instance due to conductive dust or rain or snow.

Where not otherwise specified by the applicable standards for the product, equipment for industrial applications are generally intended for their use in environment with pollution degree 3. Nevertheless, other degrees can be considered, depending on the micro-environment or on particular applications.

Use in alternating and direct current of auxiliary devices acc. to EN 60947-5-1

Alternating current use		Direct current use	
Utilization category	Intended use	Utilization category	Intended use
AC12	Control of resistive loads and solid state loads with insulation by optocouplers.	DC12	Control of resistive loads and solid state loads with insulation by optocouplers.
AC13	Control of solid state loads with transformer isolation.	DC13	Control of electromagnetic loads without economy resistors in circuit.
AC14	Control of electromagnetic loads, power ≤ 72 VA.	DC14	Control of electromagnetic loads with economy resistors in circuit.
AC15	Control of electromagnetic loads, power ≥ 72 VA.

These General Terms and Conditions of Sale exclusively govern the sale of all products sold by PIZZATO ELETTRICA SRL (VAT ID 01704080249), with registered office at Via Torino, 1 36063 Marostica (VI) - Italy

Purchase orders:

Orders must always be submitted in writing, via email or using another exchange system in digital format, subject to prior approval by Pizzato Elettrica (e.g. Metel).

Pizzato Elettrica reserves the right to reject orders received via email should they lack the appropriate details to allow correct identification of the sender and/or in the case of attachments containing viruses or which appear to be of questionable origin.

Purchase orders are finalised only once the customer has received an order confirmation from Pizzato Elettrica, which is binding for both parties. Any clauses added to the purchase order by the customer that differ from these General Terms and Conditions of Sale shall not be considered binding.

The supply includes only what is expressly stated in the order confirmation.

Order cancellation/changes:

For standard products, following issue of order confirmation by Pizzato Elettrica, the customer may submit a request for any changes to the contents of the order confirmation within the fixed period of two (2) working days from issue of order confirmation — regardless of when this is read or acknowledged.

Requests for order changes or cancellations may be accepted or declined depending on the order's progress status.

Modifications or cancellations of special article orders will not be accepted under any circumstances.

Pursuant to article 1461 of the Italian Civil Code, in the event of changes to the financial standing of the customer, Pizzato Elettrica may suspend and/or cancel supply at any time.

Changes to products:

For the purpose of improving products, Pizzato Elettrica may change them at any time, without altering their fundamental characteristics, where this is considered necessary and/or opportune, with no obligation to notify the customer beforehand and/or without changes to orders already issued.

Prices:

The prices quoted in the current price list and in the order confirmation should be considered "Ex Works" (Incoterms 2020) and do not include VAT, custom taxes or any other charges.

Unless otherwise agreed, the prices quoted in the price list are not binding and may undergo changes without prior notice.

The price of the supply is indicated on the order confirmation/invoice and, where necessary in the case of long-term scheduled orders, may be amended solely by Pizzato Elettrica subject to written communication with two (2) months' prior notice. In such cases, the customer may decide to fully or partially cancel the order, regarding only the portion still to be processed, subject to written communication via email, no later than five (5) working days from receipt of communication from Pizzato Elettrica.

Packaging:

Packaging is free of charge. For more than six boxes, pallets may be required for transport, and these are also provided free of charge.

Payment terms:

Payments due from the customer must be made in Euro by the deadline and according to the terms and conditions indicated on the invoice.

The payment method is always at the customer's risk, regardless of the means chosen.

In the event of late payment, Pizzato Elettrica reserves the right to suspend and/or cancel orders being processed, without prejudice to the right to claim compensation for any damages incurred.

It remains understood that failure to make payment by the indicated deadline will result in the customer being automatically charged default interest pursuant to European Directive 2011/7/EU, as per the amounts set out by Italian Legislative Decree 231/2002.

Any technical or commercial complaints or use of the warranty do not entitle the claimant to suspend payments due.

Minimum billing amount:

Unless specifically agreed otherwise, the minimum billing amount is EUR 200 net (VAT excluded) of product, excluding any additional charges.

For invoices of less than EUR 200, a fee of EUR 20 will be charged if delivery is within the EU, or EUR 40 if delivery is outside the EU.

Invoices are issued weekly.

Order quantities:

Some products are shipped in packs. The ordered quantities of these items must be multiples of the quantities contained in the packages.

Delivery:

The delivery period indicated in the order confirmation refers to the time when the goods are expected to be available at Pizzato Elettrica sites for pick-up, and not the date of arrival at the customer's location.

Delivery dates should always be considered approximate and not binding: failure to meet delivery dates does not represent a breach by Pizzato and, consequently, does not give rise to any right to compensation or reimbursement, nor any other right of the Purchaser, who remains bound by the terms and conditions set out in the order confirmation (e.g. payment terms).

Specifically, the customer acknowledges that the terms of delivery of goods may be subject to legitimate delays (including but not limited to difficulties in sourcing raw materials), which shall not give rise to any right to compensation and/or reimbursement.

A list of items normally kept in stock can be found at www.pizzato.com

Shipment:

Pizzato Elettrica ships goods "Ex Works" (Incoterms® 2020 published by the ICC).

At the customer's request, Pizzato Elettrica may ship goods "Delivered at Place" (DAP - Incoterms® 2020 published by ICC) with transport costs charged on the invoice to the customer by Pizzato Elettrica.

On arrival of the goods, the customer shall verify that the courier delivers all packages indicated in the transport document or accompanying invoice, ensuring they are complete and of the correct weight. In case of any inconsistencies against the transport document/accompanying invoice, and/or visible damage to the packaging, the customer must always accept the goods SUBJECT TO INSPECTION, clearly specifying the reason.

Any damage to packaging, missing packages or errors must be promptly reported to the courier, notifying Pizzato Elettrica in writing within two (2) working days from the date of receipt of the goods at info@pizzato.com. Otherwise, the goods will be considered to have been delivered in perfect condition.

Complaints:

Should the customer identify a defect in the goods or a non-conformity in relation to the order submitted, Pizzato Elettrica should be notified within eight (8) days of delivery or identification of the issue, where it is not immediately evident.

Under no circumstances will claims be accepted beyond the strict warranty deadline specified in the following section.

Warranty:

The warranty has a validity of 12 months starting from the shipping date of the material.

Pizzato Elettrica reserves the right, at its unchallengeable discretion, to evaluate the existence of any defect and/or non-conformity in the goods. The warranty does not cover products damaged due to improper use, negligence, or incorrect installation/assembly.

The warranty does not cover parts subjected to wear or products used beyond the product's technological limits described in the catalogue, or items that have not been properly maintained.

Pizzato Elettrica undertakes to repair or replace, in whole or in part, products proven to have manufacturing defects, provided that such defects are reported within the guarantee period and no later than 8 (eight) days from their discovery, in accordance with the indications set out under "Complaints".

Pizzato Elettrica is only responsible for the value of the product and requests for compensation due to machine downtime, repairs or costs for direct or indirect damages resulting from product malfunctions will not be accepted, even if these occur during the warranty period.

Any samples provided free of charge or bearing the phrase "SAMPLE" must be considered as purely demonstrative and are not covered by the guarantee.

The warranty will be subject to the customer's compliance with the payment terms.

The customer remains solely responsible for evaluating the technical characteristics of Pizzato Elettrica products and, consequently, their suitability in relation to the customer's intended use. Pizzato Elettrica cannot be held in any way responsible for the consequences arising from improper use of products, including in the case of risks to the health and safety of personnel (redundancy systems, self-controlled systems, etc.).

Returns:

Any returns, for any reason, will not be accepted unless they have been previously APPROVED and AUTHORISED in writing by Pizzato Elettrica. Otherwise, Pizzato Elettrica reserves the right to reject the goods and return them "freight collect," using the same carrier by which they were originally shipped, with all costs charged to the customer.

Authorised returns have to be sent back no later than three (3) months from the date of authorisation. After this period, returns will not be accepted.

A return request is associated with a reduction in the sale price and will be considered only for standard articles and materials shipped within the last twelve (12) months. Custom/personalised materials are not eligible for return under any circumstances.

The returned goods and the relative packaging must be returned intact and undamaged.

The customer shall bear the packaging and delivery costs associated with the return.

Transfer:

Orders cannot be transferred to third parties by the customer, unless such transfer has been previously agreed upon and authorised in writing by Pizzato Elettrica S.r.l.

Retention of title:

Where payment of goods is made after shipping and/or delivery, pursuant to Article 1523 of the Italian Civil Code, the shipped goods shall remain the property of Pizzato Elettrica until all payments due have been fully settled.

Until this time, the customer undertakes to safeguard the goods and maintain their condition for the intended use, without transferring them, selling them, or otherwise making them available to third parties.

Should the customer sell the goods to third parties prior to payment to Pizzato Elettrica, and therefore before the effective transfer of ownership, Pizzato Elettrica's retention of title persists in relation to such third parties, where permitted by law.

In the event of failure to pay or partial payment by the customer, Pizzato Elettrica shall have the right to request the return of the goods, without prejudice to its right to seek compensation for any additional damages.

Force Majeure:

Pizzato Elettrica cannot be held responsible for any delay in the fulfilment of obligations arising from these General Terms and Conditions of Sale, where such delay is caused by unforeseeable events beyond the control of Pizzato Elettrica, including but not limited to natural disasters, epidemics, rioting, strikes, at local or national level, fires or the unavailability of raw materials.

In case of a force majeure event, Pizzato Elettrica will attempt to adopt solutions that limit the consequences of the force majeure event and/or their continuation.

Privacy:

Pizzato Elettrica declares, pursuant to the GDPR (EU Regulation 2016/679) and applicable Italian legislation, that it processes the ordinary personal data of customers in compliance with the aforementioned legislation and, in any case, only to the extent and for the purposes strictly necessary for the execution of the contract.

Final clauses:

Any amendment or addition necessary to these General Terms and Conditions of Sale must be agreed between the parties in writing, otherwise being null and void.

In the event that any of the provisions is or becomes ineffective or impossible to implement or in the event that these General Terms and Conditions of Sale are found to be incomplete, the remaining provisions of these terms and conditions shall remain valid and applicable.

Any failure to exercise, including on multiple occasions, by either of the parties, a right deriving from these General Terms and Conditions of Sale shall not represent a waiver of such right nor of any other rights established herein.

Applicable law:

For all aspects not expressly indicated herein, Italian law shall apply.

Dispute resolution:

Any dispute regarding these General Terms and Conditions of Sale or the sale/purchase relationship with the customer shall fall under the exclusive jurisdiction of the Court of Vicenza.

For the updated terms of sale, please consult the website www.pizzato.it

Notes

[illegible]This image shows a full page of blank graph paper. The grid consists of small, equal-sized squares formed by thin, dark gray lines. There are 20 columns and 20 rows of these squares, creating a total of 400 small square units. The grid covers the entire area of the page, leaving no margins or other markings.
